## **1. INTRODUCTION**

## 1.1 BACKGROUND

Kleinfelder Australia Pty Ltd (Kleinfelder) was engaged by Williamtown Sand Syndicate (WSS) to undertake a 12 month surface water and groundwater monitoring program to establish baseline conditions at the Newcastle Sands quarry site, 298 Cabbage Tree Road, Williamtown, New South Wales (NSW) (the 'Site'). The Site is located approximately 12 km north east of Newcastle at Williamtown, NSW. The location of the Site is depicted on **Figure 1** and the site layout is presented in **Figure 2**. This revised version of the Kleinfelder (March 2020) Baseline Water Quality Summary Report addresses comments provided by the NSW Department of Planning, Industry & Environment (DPIE).

Monitoring was undertaken to satisfy the requirements of the Soil and Water Management Plan (SWMP) (KLF, 2019) and Environmental Protection Licence 21264 (EPL). It is noted that the SWMP is a sub-plan within the overarching 'Newcastle Sands Quarry Environmental Management Plan' (June 2018), referred to herein as the EMP.

Groundwater and surface water monitoring was conducted over 12 consecutive months from February 2019 through to January 2020 and was generally completed between the 11<sup>th</sup> and 18<sup>th</sup> of each month. A Sampling Plan was prepared and presented in the SWMP, covering an appropriate methodology and quality control requirements for the monitoring program (see **Section 3** for further details).

The Sampling Plan was designed to obtain representative background data on water flow and quality in surface water bodies and groundwater that has the potential to be impacted by the site operations, or unrelated off-site sources. The SWMP identifies that, unless amended, the ongoing surface water and groundwater monitoring program will be consistent with the baseline water quality program.

## 1.2 PURPOSE OF THE BASELINE SUMMARY REPORT

The SWMP identifies that on completion of the baseline monitoring program, the following parameters would be reviewed and advice provided regarding ongoing monitoring requirements including:

- Location of sampling points, e.g. more suitable / representative location identified, or sampling location has insufficient water to accurately monitor development;
- The frequency of the sampling may be reduced, or increased, depending on the fluctuations in the results; and

• The parameters may be adjusted to remove superfluous analytes and/or add additional analytes.

## **1.3 OBJECTIVES**

The objectives of the monitoring program were to:

- Establish background groundwater and surface water conditions across the Site;
- Establish site specific trigger values to be used during the operation of the quarry whereby concentrations outside these trigger values need to be reviewed in more detail; and
- Develop an ongoing sampling program (frequency and analysis) that will maintain compliance with the conditions of the EPL and EMP.

## 1.4 SCOPE OF WORK

The following provides the scope of work to deliver the baseline water quality summary report:

- Review and present Site characteristic information;
- Provide an assessment of quality assurance (QA) and quality control (QC) undertaken over the 12-month period and validate the data;
- Provide a summary of the water quality identified across the Site including:
  - Field observations;
  - Analytical results; =
  - Trend analysis;
- Establish trigger values for review against ongoing sampling; and
- Propose an ongoing monitoring program to be conducted during operations that will maintain compliance with the EMP and EPL.

The scope of work for each of the background monitoring rounds can be seen in the monthly summary reports.

## 2. SITE CHARACTERISTICS

## 2.1 SITE IDENTIFICATION DETAILS

Table 2.1 provides site-specific identification details.

| Site address                            | 298 Cabbage Tree Road Williamtown, NSW.  |  |  |  |  |  |  |
|---|--|--|--|--|--|--|--|
| Site name                               | ewcastle Sands Quarry.   |  |  |  |  |  |  |
| Current Title<br>identification details | <ul> <li>Four titles within the Parish of Stockton, County of Gloucester including:</li> <li>Lot 1 DP 224587 at 398 Cabbage Tree Road, Williamtown</li> <li>Lot 121 DP 556403 at 282B Cabbage Tree Road, Williamtown.</li> <li>Lot 11 DP 629503 at 282A Cabbage Tree Road, Williamtown.</li> <li>Lot 1012 DP 814078 at 282 Cabbage Tree Road Williamtown</li> </ul>            |  |  |  |  |  |  |
| Current land use                        | Currently the Site comprises mostly native vegetation. Initial quarry works have progressed to include pre-works hardstand areas and administration buildings.   |  |  |  |  |  |  |
| Site total area                         | Total Project Area of approximately 42.3 hectares from a Subject Land Area of approximately 176.2 hectares.  |  |  |  |  |  |  |
| Current ownership                       | Port Stephens Shire Council under lease to Williamtown Sand Syndicate Pty Ltd.   |  |  |  |  |  |  |
| Current land use<br>zoning              | The Site is currently RU2 – Rural Landscape (Port Stephens LEP 2013).  |  |  |  |  |  |  |
| Local government                        | Port Stephens Council.   |  |  |  |  |  |  |
| Proposed site use                       | Sand quarry extracting up to 530,000 tonnes per annum over a period of 6 to 15 years including the construction of an intersection with Cabbage Tree Road, sealed and gravel access roads, site office, workshop and weighbridges.<br>Progressive rehabilitation of quarried land returning to native vegetation communities with potential future use of the facilities area. |  |  |  |  |  |  |

#### Table 2.1 Site details

## 2.2 CURRENT LAND USE

The Site currently has a workshop, office area comprising of demountable buildings, gravel aggregate hardstand areas for transitioning vehicles and future sorting. The areas surrounding the immediate vicinity of the Site comprise predominantly natural vegetation with exception to a gravel road, two former silica sand extraction areas and the verge of Cabbage Tree Road.

## 2.3 FORMER LAND USE

The Project Area consists predominantly of native vegetation, with some previously cleared areas present in the eastern part of the Site. Approximately 48 ha of the 176.2 ha Site was previously disturbed by heavy mineral sand mining and associated activities that were undertaken on the Site between 1970s and late 1990s. This disturbance included areas that were dredged as part of extracting heavy minerals, sand borrow pits, settling ponds, monazite trenches and access roads.

In March 2002, Port Stephens Council (PSC) purchased four allotments comprising the project area (398, 282B, 282A and 282 Cabbage Tree Road Williamtown) from Rutile and Zircon Mines and was subsequently used for cattle adjustment. In 2012 PSC sought tenders from interested parties for the extraction of sand from the project area.

## 2.4 SURROUNDING LAND USE

The Williamtown RAAF base is located 2.5 km to the north east, with Fullerton Cove approximately 600 m to the south and the Hunter River estuary beyond (**Figure 1**).

Residential dwellings are located to the east (closest dwelling is 244 m), south (closest dwelling is 61 m) and west (closest dwelling is 83 m) of the Site. Most are small properties utilised as hobby farms (e.g. keeping horses and chickens), some are larger and also graze livestock. Potable water for dwellings is likely to comprise primarily reticulated water from Hunter Water network and rainwater. Many properties appear to have spear point wells installed for stock and domestic use. No dwellings are located within 4 km north of the Site.

## 2.5 GEOLOGY

Review of the Newcastle 1:250,000 series geological map (Sheet S1 56-2, 1966) indicates that the site is underlain by Quaternary aged marine and freshwater deposits comprising gravel, sand, silt, clay and "Waterloo Rock".

The majority of the Site is located above the Tomago Sandbeds. The Tomago Sandbeds were formed during the Pleistocene era with the original sand deposits occurring up to 250,000 years ago. Rising sea levels created a large bay extending from Newcastle to Port Stephens. The Hunter and Karuah Rivers both flowed into the bay and deposited large volumes of sand. A combination of wave and wind action spread the sand along the coastline and formed the series of shallow dunes that make up the Tomago Sandbeds (Hunter water website 15/08/2018).

The sand dunes consist of a layer of highly permeable fine-grained sands underlain by impervious clay and rock. The thickness of the sand layer reaches a maximum of 50 metres, but on average is 20 metres deep (Hunter Water website 15/08/2018).

The North Stockton Sandbeds, which form the current coastline between Newcastle and Port Stephens, were deposited much more recently than the Tomago Sands. They overlie the eastern extremity of the Tomago Sands and were deposited in the Holocene era (10,000 years ago) (Hunter water website 15/08/2018).

## 2.6 HYDROLOGY & HYDROGEOLOGY

#### 2.6.1 Surface Water

The high permeability of the Tomago Sandbeds results in little or no defined surface runoff, noting no defined natural drainage lines are on the Site. Drainage is therefore predominantly via vertical infiltration into the sand, with any ephemeral surface drainage generally expected to be in the direction of the existing surface slopes.

In the area around the Site, the Tomago Sandbeds are located on the edge of low lying (about 2-3 m AHD) Holocene aged freshwater and alluvial and estuarine swamps deposits. These low-lying areas adjoining the Site are frequently waterlogged during high rainfall, due to increasing and shallow groundwater levels and a shallow groundwater gradient that slows the percolation of surface water. It is likely that the majority of accessible surface water onsite is an expression of groundwater, typically created through man made excavation.

The western portion of the southern and norther resources areas theoretically drain to the west, while the dominant surface drainage direction for most of the Site is to the east (i.e. Catchments 2 and 3 above). Here the landform drops from the edge of the resource area around 5 m AHD to the swamp or flats over a relatively short distance with the gradient reaching up to 16%. The swamp areas have a gradient of approximately 0.1% with the elevation falling 1.5 m over the 1100 m to the eastern boundary of the Subject Land with water conveyed by an open constructed channel (in middle of Catchment 3).

From the eastern boundary of the Site, drainage is directed via constructed channels through to Dawsons Drain and the northern extent of Fullerton Cove where the elevation drops 1 m over 1900 m (with an average gradient of 0.05%).

For the south eastern portion of the Project area, a portion of the resource area has the potential to drain south east across the Subject Land to a culvert beneath Cabbage Tree Road (Catchment 4). In this area the landform drops at about 14% to the swamp or flats that then appears to have a very slight gradient to the south eastern corner of the Site (i.e. less than 0.5 m over at least 140 m). From this point the area drains via series of constructed channels through to the Ring Drain, a large constructed channel around the northern extent of Fullerton Cove over a distance of 590 m with an average gradient of less than 0.4%. Inspection of the Site shows this culvert is only likely to flow during periods of extended rainfall and a high-water table.

Cabbage Tree Road has been built up during its construction, with shallow table drains constructed partially along the northern side of the road and deeper drains constructed partially

along the southern side. The nearest culvert is located at the eastern extent of the subject land, approximately 80 m beyond the proposed road construction area.

Following quarrying at the site the catchments will progressively change with Catchment 3 increasing in size with water from within the quarry footprint (currently draining west) directed south east into Catchment 3 (i.e. Catchment 1 will drain to Catchment 3). However, given the high permeabilities it is highly unlikely that any changes in flow would be realised across the site.

#### 2.6.2 Groundwater

The Site is located on highly permeable Pleistocene Tomago Sandbeds (sand dunes). The source of the water within the Tomago Sandbeds is rainfall that lands directly on the sand surface. While a proportion of the rainfall is lost to plants and evaporation, sufficient water is stored in the sand to provide a viable and significant source of water for ongoing extraction. Over time rainfall landing on the sandbeds has washed out any remnants of sea salt leaving the deep sand system full of fresh water (Hunter Water website 15/08/2018).

A previous groundwater investigation was undertaken by RCA Australia (RCA Australia, 2015), groundwater was encountered on the Site ranging from 0.67 m below ground level (mbgl) to 15.65 mbgl. Groundwater when at its highest is visible at or near the surface for land below 3 m AHD. Groundwater at the Site has a low hydraulic gradient and was interpreted to flow in a general southerly to south-easterly direction, towards Fullerton Cove (RCA Australia, 2015) from Grahamstown Dam in the north toward Fullerton Cove in the south, the groundwater gradient within the local area is less than 0.2%.

The northern portion of the Site is located within the Hunter Water Special Area, owing to the presence of the Tomago Sandbeds and their use for a portion of the lower Hunter's drinking water supplies.

The Project area and extent of extraction has been designed such that sand extraction remains a minimum of 0.7 m above the highest predicted groundwater level, with the final landform to be established at no less than 1 m above the highest predicted groundwater level (about 2 m above the average level).

## 2.7 RCA GEOTECHNICAL AND GROUNDWATER INVESTIGATION

A geotechnical and groundwater investigation was undertaken by RCA Australia in 2015 to provide input into the characterisation of Site resources for the extraction of sand and to

provide further information on background groundwater quality and elevations across the Site in preparation for the preliminary Site Environmental Impact Statement.

As part of the investigation, the installation of 12 groundwater monitoring wells were undertaken including subsequent soil and groundwater analyses. Soil logs including groundwater and soil results from RCA Australia, 2015 are provided as **Appendix A**.

## 3. BACKGROUND MONITORING PROGRAM

## 3.1 SAMPLING PLAN

The SWMP required monthly sampling to be undertaken over a 12-month period to characterise background groundwater and surface water conditions throughout the Site.

10 groundwater (BH1, BH2, BH4, BH6, BH7, BH8, BH9, BH10, BH11 and MW239S) and 4 surface water (SW1, SW2, SW3 and SW4) locations were sampled throughout the 12 monitoring rounds as outlined in **Figure 2**. The remaining Site wells (BH3, BH12, MW239D and BH5) were used to provide additional groundwater elevation data.

Each monitoring event included sampling for:

- General water quality parameters: (Calcium (Ca), Magnesium (Mg), Sodium (Na), Potassium (K), pH, Electrical Conductivity (EC), Chloride (Cl), Sulphate (SO<sub>4</sub>), Alkalinity, Hardness & Total Dissolved Solids (TDS) (Calc'));
- Total Recoverable Hydrocarbons (TRH);
- Total Petroleum Hydrocarbons (TPH);
- Benzene, Toluene, Ethylbenzene, Total Xylenes, Naphthalene (BTEXN);
- Metals (Arsenic (As), Boron (B), Barium (Ba), Beryllium (Be), Cadmium (Cd), Chromium (Cr), Cobalt (Co), Copper (Cu), Iron (Fe), Lead (Pb), Manganese (Mn), Mercury (Hg), Nickel (Ni), Selenium (Se), Vanadium (V), Zinc (Zn)); and
- PFAS including Perfluorooctane sulfonate (PFOS), Perfluorooctanoic acid (PFOA), Perfluorohexanesulfonate (PFHxS) & Perfluorodecane sulfonic acid (PFDS).

Each well location was gauged using a water level meter to determine groundwater depth (relative to the top of the well casing) and the total depth of the well, in order to calculate the volume of water in the well. Following gauging, a high-density polyethylene (HDPE) HydraSleeve<sup>™</sup> was then placed into the well ensuring the top of the sleeve was located below standing water level and left in place while all remaining wells were gauged. Following gauging, each of the HydraSleeves were removed and representative groundwater samples taken. Hydrasleeves<sup>™</sup> were applied to this project as outlined in the SWMP and as recommended within the PFAS National Environmental Management Plan (Version 2.0, January 2020) given their suitability for sampling of PFAS.

The baseline sampling program also included an initial sampling round and quarterly monitoring where additional analysis was included for an extended water quality suite (including hardness, Nitrate, Nitrite, Ammonia, Reactive Phosphorous, Total Nitrogen and

TKN). Some additional groundwater monitoring locations were also included in quarterly monitoring as identified in **Table 3.1**.

Table 3.1 2019-2020 Monitoring Schedule

1: Sample locations were dry

\* Shaded months indicate quarterly sampling suite

Following each monitoring round, a monthly factual letter report was prepared (see **Appendix B**). Each report presented:

- The field observations and field data;
- The results of the laboratory analysis;
- A comparison of the results against industry guidelines; and
- Rainfall data from the preceding month.

## 3.2 FIELD OBSERVATIONS

#### 3.2.1 General

Surface water and groundwater monitoring was initiated in February 2019 and continued each month for a duration of 12 months until January 2020. Sampling times were generally consistent, undertaken each time within the middle of the month (between the 11<sup>th</sup> and 18<sup>th</sup> of the month). Within the first two monitoring rounds (February and March) re-insertion of PVC piping was required at fire effected location BH1 and for root bound effected location BH12. Site works, focussing on initial Site infrastructure and access roads, began in October 2019 in preparation for the proposed quarry extraction works which are expected to initiate from early to mid-2020.

### 3.2.2 Monitoring Location Observations

Groundwater and surface water observations made during gauging and sampling at monitoring locations BH1, BH2, BH3 BH4, BH6, BH7, BH8, BH9, BH10, BH11, MW239S, SW1, SW2,

SW3 and SW4 are summarised below. Conditions at each location were generally consistent throughout the monitoring period with the exception of surface water which provided intermittent periods of accessible water throughout the monitoring program.

Sensory observations of visual and olfactory quality were made on groundwater and surface water during sampling. A summary of these observations is presented in **Table 3.2** below.

| Location            | General Observations  |
|---------------------|---|
| BH1                 | Generally, slightly cloudy brown with occasional sulfur odour. Well was reinstated in February 2019 following fire damage. The month following reinstatement an acrylic odour was detected which was most likely a bonding material used to fuse the PVC well piping together.                          |
| BH2 <sup>1</sup>    | Mostly dark brown in colour with a silty material at the base of well. A slight sulfur odour was evident throughout the monitoring period.  |
| BH3                 | Prior to well decommissioning in September 2019 due to initial site works, observations of groundwater were identified as light brown with no odour. Well base contained fine silty material. No samples were taken following initial sampling round in February 2019.                                  |
| BH4 <sup>1</sup>    | Generally light brown in colour with slight sulfur odour.   |
| BH5                 | Generally light brown with no apparent odour. No samples taken throughout the monitoring program, only gauging.   |
| BH6 <sup>2</sup>    | Generally, light brown in colour with a slight sulfur odour.  |
| BH7 <sup>1</sup>    | Generally, light to moderately brown in colour with a slight sulfur odour.  |
| BH8                 | Generally, brown to dark brown in colour with a moderate sulfur odour.  |
| BH9 <sup>1</sup>    | Well was dry for the duration of the baseline monitoring program.   |
| BH10                | Well was dry for the duration of the baseline monitoring program.   |
| BH11 <sup>2</sup>   | Generally, cloudy light brown with a moderate sulfur odour.   |
| BH12                | Well was reinstated in March 2019 following inundation of roots into the well. A 40mm inner PVC pipe was installed. The months following reinstatement of a well an acrylic odour was detected which was most likely a bonding material used to fuse the PVC well piping together. No sample was taken. |
| MW239S1             | Cloudy dark brown in colour with a moderate sulfur odour.   |
| MW239D              | Cloudy dark brown in colour with a moderate sulfur odour. No sample was taken.  |
| SW01                | Intermittent periods of pooling at monitoring location. Water is generally stained with natural tannins, dark brown with a slight sulfur odour.   |
| SW02                | Monitoring location was observed to be dry for the duration of the baseline monitoring program.   |
| SW03                | Water mostly clear with no apparent odour. Often water was stagnant and at times dry.   |
| SW04                | Water mostly clear with no apparent odour. Often water was stagnant and at times dry.   |

#### **Geochemical Parameters and Gauging Data** 3.2.3

Geochemical parameters and gauging data were recorded during the sampling program and are presented on field sheets in Appendix C and summarised as maximum and minimum values in Table 3.3 and Table 3.4.

|                        | January 2 |       |                         |            |             |         |            |       |  |

1– One sampling event (Feb 2019) and well decommissioned September 2019

2 - One sampling event (Feb 2019)

3 – No sampling undertaken

4 - Surface water levels (mm) identified from measured stake at each location (When dry number is ground elevation AHD) NA – Not applicable

## 3.3 GROUNDWATER AND SURFACE WATER ANALYSIS

#### 3.3.1 Industry Guidelines

In order to understand background surface and groundwater quality in relation to published data, laboratory results were compared against trigger values found in industry guidelines as outlined in the SWMP.

An exceedance of any adopted trigger value does not necessarily indicate that there is an unacceptable risk on site (CRC-CARE Technical Report 10: 2011), but rather identifies the need to explore the results in more detail. For this report we are reviewing natural background conditions and this comparison identifies the quality of the natural conditions indicative of the Site and regional area.

The following industry guidelines have been used for baseline characterisation:

- Australian and New Zealand Environment and Conservation Council (ANZECC) & Agriculture and Resource Management Council of Australia and New Zealand (ARMCANZ), Water Quality Guidelines for Fresh and Marine Water Quality 95% species protection for fresh water (ANZECC 2000);
- The Heads of Environmental Protection Authorities in Australia and New Zealand (HEPA) Per- and polyfluoroalkyl substances (PFAS) National Environmental Management Plan (NEMP 2018); and
- Australian Drinking Water Guidelines 6 (ADWG) (2011).

#### 3.3.2 Summary of results

Summary tables outlining the analytical data obtained from the Baseline Monitoring Program, and a comparison against trigger values are provided within the **Tables** section at the rear of this report. **Table 3.5** below provides a summary of groundwater and surface water concentrations as a range (minimum to maximum) for all analytes across the Site.

An assessment of Kleinfelder's Quality Assurance and Quality Control (QA/QC) processes and procedures has been provided in **Section 6**. Laboratory Certificates of Analysis (COA) including laboratory QC reports are presented as Appendix A of the monthly reports, which have been provided as **Appendix B** of this document.

1 – Default trigger values for physical and chemical stressors, for slightly disturbed ecosystems in lowland rivers, Southeast Australia (value is for base flow and not storm event)

2 – Aesthetic

3 – HEPA NEMP 2020 99% level of protection in freshwater

4 – HEPA NEMP 2020 Recreation Water

## 4. BASELINE WATER QUALITY ASSESSMENT

## 4.1 METALS

Elevated concentrations of chromium above trigger values (ANZECC 2000) were recorded at monitoring locations BH1, BH2, BH3, BH7, BH8, BH11, MW239S and SW3. Concentrations ranged from <0.001mg/L - 0.004 mg/L for groundwater and from <0.001 – 0.002 mg/L for surface water.

Elevated concentrations of copper above trigger values (ANZECC 2000) were recorded at monitoring locations BH1, BH2, BH4, BH6, BH7, BH8, BH11, MW239S, SW1, SW3 and SW4. Concentrations ranged from <0.001mg/L - 0.051 mg/L for groundwater and from <0.001 mg/L – 0.02 mg/L for surface water.

Elevated concentrations of iron above trigger values (ADWG) were recorded at all monitoring locations. Concentrations ranged from <0.05 mg/L – 12.5 mg/L for groundwater and from 0.57mg/L– 9.26 mg/L for surface water. Iron concentrations were particularly higher at location BH1.

Elevated concentrations of manganese above trigger values (ADWG) were recorded at monitoring location SW1. Concentrations ranged from <0.003 mg/L - 0.136 mg/L for groundwater and from 0.026 mg/L- 0.841 mg/L for surface water.

Elevated concentrations of nickel above trigger values (ANZECC 2000) were recorded at monitoring locations BH2, BH4, BH7, BH8, SW1, SW3 & SW4. Elevated concentrations of nickel above trigger values (ADWG) were recorded at monitoring locations BH3, BH4 and BH11. Concentrations ranged from <0.001 mg/L – 0.07 mg/L for groundwater and from <0.001 mg/L– 0.02 mg/L for surface water.

Elevated concentrations of zinc above trigger values (ANZECC 2000) were recorded at monitoring locations BH1, BH2, BH4, BH6, BH7, BH8, BH11, MW239S, SW1, SW3 and SW4. Concentrations ranged from <0.005 mg/L – 1.27 mg/L for groundwater and from <0.005 mg/L – 0.535 mg/L for surface water.

## 4.2 PHYSICAL AND CHEMICAL STRESSORS

Elevated concentrations of sulphate above trigger values (ADWG aesthetic) were recorded at monitoring location SW1. Concentrations ranged from 2.0 mg/L – 7.0 mg/L for groundwater and from 16 mg/L – 324 mg/L for surface water.

An elevated concentration of reactive phosphorus above trigger values (ANZECC 2000) default trigger values was recorded at BH1. Concentrations ranged from <0.01 – 0.03 mg/L for groundwater and <0.01-0.13 mg/L for surface water.

Elevated concentrations of total phosphorus above trigger values (ANZECC 2000) were recorded at monitoring locations BH1 and BH2. Concentrations ranged from <0.01 mg/L – 2.11 mg/L for groundwater and from 0.01 mg/L – 0.13 mg/L for surface water.

Elevated concentrations of total nitrogen above trigger values (ANZECC 2000) were recorded at monitoring locations B2, BH3, BH4, BH5, BH6, BH7 BH8, BH11, MW239S, SW1 and SW3. Concentrations ranged from <0.01 mg/L – 2.11 mg/L for groundwater and from 0.01 mg/L – 0.13 mg/L for surface water

Elevated concentrations of Total Hardness as  $CaCO_3$  above trigger values (ADWG aesthetic) were recorded at monitoring location SW1. Concentrations ranged from 5.0 mg/L – 41 mg/L for groundwater and from 26 mg/L – 299 mg/L for surface water.

Elevated concentrations of Total Dissolved Solids above trigger values (ADWG aesthetic) were recorded at monitoring location SW1. Concentrations ranged from 35 mg/L – 285 mg/L for groundwater and from 143 mg/L – 708 mg/L for surface water.

Concentrations of pH were below/outside the trigger value range at all monitoring locations. Concentrations ranged from 4.37– 6.29 for groundwater and from 4.0– 6.21 for surface water.

## 4.3 TPH, TRH AND BTEXN

No hydrocarbon exceedances above adopted criteria were recorded throughout the 12-month monitoring program. Detections were recorded at locations BH1 and BH4. Detections of hydrocarbons at BH1 can be attributed to an acrylic adhesive used for the reinstatement of the above ground section of the well. Detections of hydrocarbons at BH4 followed in close succession with rainfall recorded in the region. BH4 is located adjacent to Cabbage Tree Road and detected concentrations may be attributed to roadway runoff.

## 4.4 PFAS

One detection of PFOS above adopted aquatic criteria (LOR) protection was recorded at SW4 (0.03  $\mu$ g/L) and subsequently identified again (0.05  $\mu$ g/L) during follow-up sampling one week later. Further detections above LOR were identified at BH4 (PFDS -0.02  $\mu$ g/L) and BH6 (6:2 FTS – 0.19  $\mu$ g/L). Detections of PFAS at SW4 followed on from recent rainfall in the area which may have contributed to groundwater migration from surrounding known sources (i.e.

Williamtown RAAF Base). Kleinfelder would expect local groundwater to exceed the aquatic criteria given the scale of PFAS reported in groundwater within the Red Zone.

## 4.5 TREND ANALYSIS

A description of the trends observed throughout the 12-month monitoring period are provided in the sections below and graphical representations are located in the **Chart** section at the rear of this report.

### 4.5.1 Rainfall

Rainfall for the Site was generally well below the mean average (1942-present) for the locality (BOM Williamtown RAAF 61078) over the 12-month monitoring period. Rainfall exceedances above the mean were recorded in March, June, August and September 2019 with the remainder of months experiencing significantly lower rainfall than would normally be expected. The total rainfall recorded over the 12-month monitoring program was 731.8mm which is 486.4mm less than the yearly mean total of 1218.2mm. **Chart 1** provides a graphical representation of rainfall totals for each month.

#### 4.5.2 **Groundwater Elevation**

Groundwater throughout the sampling locations demonstrated a general decline in elevations throughout the 12-month period. Most notably the greatest decline in groundwater elevations was observed in the months following the November 2019 water monitoring event which correlate directly with a significant decrease in rainfall from the mean average and increase in temperatures. **Chart 2** provides a graphical representation of groundwater elevation identified following gauging throughout the 12-month monitoring period.

### 4.5.3 Mann Kendall Analysis

Where sufficient data is available, statistical trend analysis using the Mann-Kendall Trend Test has been undertaken for selected analytes at EPL and SWMP monitoring points to determine if obvious trends were apparent in the dataset (**Table 4.1** and **Table 4.2**). The purpose of the Mann-Kendall Test (Mann 1945, Kendall 1975, Gilbert 1987) is to statistically assess if there is a monotonic upward or downward trend of the variable of interest over time. A monotonic upward (downward) trend means that the variable consistently increases (decreases) through time, but the trend may or may not be linear.

MKA relies on three statistical metrics including:

• **The** 'S' Statistic: Indicates whether concentration trend vs. time is generally decreasing (negative S value) or increasing (positive S value).

- The Confidence Factor (CF): The CF value modifies the S Statistic calculation to indicate the degree of confidence in the trend result, as in 'Decreasing" vs. "Probably Decreasing" or "Increasing" vs. "Probably Increasing." Additionally, if the confidence factor is quite low, due either to considerable variability in concentrations vs. time or little change in concentrations vs. time, the CF is used to apply a preliminary "No Trend" classification, pending consideration of the COV.
- The Coefficient of Variation (COV): The COV is used to distinguish between a "No Trend" result (significant scatter in concentration trend vs. time) and a "Stable" result (limited variability in concentration vs. time) for datasets with no significant increasing or decreasing trend (e.g. low CF).

Where an analyte has recorded a non-detect following laboratory analysis half of the value of detection (LOR) has been applied.

**Table 4.1** and **Table 4.2** provide trend analysis on sampling locations for a number of chemicals, primarily those identified in the EPL as requiring analysis. The trend analysis identifies if the chemical is stable, increasing or decreasing in concentration. This will be useful in future monitoring should a sample be found to be above the adopted trigger value, triggering further assessment.

The majority of the chemicals were found to be stable or no trend was identified. This is typically expected from background monitoring programs. A number of monitoring locations have identified decreasing trends (i.e. Barium is decreasing in BH4, BH11, SW3 and SW4 and Manganese is decreasing in BH2, BH7, SW1 and SW3). Only a few locations were found to be have an increasing trend (Copper in BH2, Chromium in BH8). Throughout the 12-month sampling period NSW was undergoing one of the worst drought periods on record. Changing concentrations of some chemicals may be due to natural fluctuations in in the water (especially following a rainfall event) and/or could be due to the drought conditions. Should this be the case then when periods of heavy rainfall occur it is likely that changes in chemical concentrations may also occur.

## 5. SITE SPECIFIC ASSESSMENT CRITERIA

## 5.1 SWMP & EMP REQUIREMENTS

As identified in **Section 1.1**Error! Reference source not found. and **1.2** the SWMP requires that surface and groundwater monitoring is to continue as identified in **Section 1.2**. However, it also states that the following monitoring parameters will be reviewed:

- Location of sampling points, e.g. more suitable / representative location identified, or sampling location has insufficient water to accurately monitor development;
- The frequency of the sampling may be reduced, or increased, depending on the fluctuations in the results; and
- The parameters may be adjusted to remove superfluous analytes and/or add additional analytes.

Therefore, this section presents a review of the parameters identified and makes recommendations for the ongoing monitoring program. It is noted that any proposed changes must be approved by the Department's Secretary (or delegate) and must also be updated in the SWMP.

## 5.2 EPL REQUIREMENTS

The Sites EPL minimum requirements for the monitoring of groundwater are outlined in **Table 5.1** below.

| Pollutant    | Unit of measure                        | Frequency | Sampling Method | Sample location                           |
|--------------|--|-----------|-----------------|---|
| Arsenic      | mg/L                                   | Monthly   | Grab Sample     | BH2, BH4, BH6, BH7, BH9,<br>BH11 & MW239S |
| Conductivity | mS/cm                                  | Monthly   | Grab Sample     | BH2, BH4, BH6, BH7, BH9,<br>BH11 & MW239S |
| Depth        | М                                      | Monthly   | Grab Sample     | BH2, BH4, BH6, BH7, BH9,<br>BH11 & MW239S |
| Iron         | mg/L                                   | Monthly   | Grab Sample     | BH2, BH4, BH6, BH7, BH9,<br>BH11 & MW239S |
| Manganese    | mg/L                                   | Monthly   | Grab Sample     | BH2, BH4, BH6, BH7, BH9,<br>BH11 & MW239S |
| рН           | рН                                     | Monthly   | Grab Sample     | BH2, BH4, BH6, BH7, BH9,<br>BH11 & MW239S |
| Turbidity    | Nephelometric Turbidity<br>Units (NTU) | Monthly   | Grab Sample     | BH2, BH4, BH6, BH7, BH9,<br>BH11 & MW239S |

Table 5.1EPA Site water monitoring requirements (EPL21264)

## 5.3 ANALYTICAL PARAMETERS

This section provides details on the recommended analytical suite for ongoing monitoring (note this is in addition to the requirements of the EPL).

#### 5.3.1 Metals

Beryllium, Cadmium, Mercury, Selenium, Vanadium were all identified to be below the laboratory LOR throughout the 12-month sampling period. The operations across the Site are not considered likely to introduce sources of these metals and therefore it is not considered necessary to continue to monitor for these metals. Analysis for lead identified only four samples out of 124 to be above the LOR and these were reported at the LOR. Analysis for Cadmium identified only 3 samples at SW1 to be at or marginally above the LOR. It is recommended that Lead and Cadmium also be removed from the monitoring programme.

Concentrations of Boron were identified to be present above the LOR in 7 samples. However, the exception is SW1 where all samples taken had concentrations above LOR. Cobalt was found to be above LOR in one sample with the exception of surface water and in BH7. There are no trigger values presented in the ANZECC 2000 guidelines. It is considered unlikely that the quarrying operations would introduce Boron and Cobalt into the environment at significant concentrations and therefore it is recommended that Boron and Cobalt not be analysed in groundwater. However, due to the presence of Boron in SW1 and Cobalt in the surface water, both Boron and Cobalt should continue to be monitored in surface water. Should future surface water monitoring identify an increase in Boron or Cobalt concentrations, then consideration should be given to adding these to the groundwater analytical suite.

It is recommended that 8 Metals continue to be analysed in groundwater and surface water:

- Arsenic (this is required by the EPL);
- Barium (all samples were above LOR, there is no ANZECC criteria for Barium);
- Chromium (samples were found to be above LOR and some samples were found to be above the ANZECC trigger criteria);
- Copper (samples were found to be above LOR and some samples were found to be above the ANZECC trigger criteria);
- Iron (this is required by the EPL);
- Manganese (this is required by the EPL);
- Nickel (samples were found to be above LOR and some samples were found to be above the ANZECC trigger criteria); and
- Zinc (samples were found to be above LOR and some samples were found to be above the ANZECC trigger criteria).

An additional two metals (Boron and Cobalt) should also be analysed in surface water.

#### 5.3.2 Nutrients

Concentrations of Total Phosphorous and Total Nitrogen were found to be elevated above ANZECC 2000 Trigger Values for a low land river in south-east Australia in a number of sampling locations on multiple occasions.

Concentrations of Ammonia were also identified to be present above LOR, however, concentrations were all recorded below the ANZECC 2000 Trigger Values and aesthetic ADWG values.

It is therefore considered appropriate to maintain sampling to identify potential significant changes in concentrations that would impact the local environment.

#### 5.3.3 Hydrocarbons

With the exception of 4 samples, all concentrations were found to be below the LOR. However, the quarry operations plan to store diesel fuel on Site for the operational plant. The Site will also have a maintenance workshop where oils, greases, lubricants and cleaning agents (degreasers) will be stored and used on Site. It is therefore necessary to continue to monitor for hydrocarbons.

It is recommended that TRH continues to be monitored. Should the TRH identify concentrations of  $C_6$  to  $C_{10}$  then this should trigger further analysis of BTEXN. Likewise, should concentrations of  $C_{16}$  to  $C_{40}$  be identified then this should trigger the analysis of PAH.

#### 5.3.4 PFAS

The majority of results were identified to be below the LOR. However, due to the sensitive nature of PFAS and the location of the Site being on the edge of the Williamtown Red Zone, PFAS monitoring should continue.

## 5.4 LOCATIONS

BH2, BH4, BH6, BH7, BH9, BH11 and MW239S are required to be monitored on a monthly basis as part of the EPL requirements. It is noted that MW9 has been dry consistently through the background monitoring period.

In addition to the above it is recommended that BH8 also be monitored.

## 5.5 SCHEDULE

Monthly monitoring is required by the EPL. It is not recommended that additional monitoring be undertaken above this every month (however we understand that DPIE has requested Site to make minor modifications to the below program e.g. monthly PFAS monitoring).

It is recommended that quarterly monitoring be undertaken to include:

- 8 metals (as identified above);
- TRH;
- PFAS;
- Nutrients (Total Phosphorus, Total Nitrogen and Ammonia as N); and
- and the inclusion of sampling BH8.

As part of the quarterly monitoring, all available wells should be gauged for groundwater depths and observed for monitoring well condition.

In order to review and confirm the continued relevance of the outcome of this summary document and proposed analytical program, an annual monitoring event should be undertaken including all analytes and locations sampled as part of the background monitoring.

Additional analysis may be required should there be a recorded spill event or other potential pollution incident.

### 5.6 SUMMARY OF PROPOSED SAMPLING

**Table 5.2** provides a summary of the proposed ongoing operational monitoring schedule for the Site. **Table 5.3** provides a summary of the proposed testing schedule for the different monitoring events .

| Location                                    | Monthly      | Quarterly    | Annually     |
|---|--------------|--------------|--------------|
| BH2, BH4, BH6, BH7, BH9, BH11 and<br>MW239S | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| BH8<br>SW1, SW2, SW3, SW4                   |              | $\checkmark$ | ✓            |
| BH1, BH5, BH12                              |              |              | $\checkmark$ |

## 5.7 SITE SPECIFIC TRIGGER VALUES

As discussed in **Section 1.3** one of the objectives of this report is to establish Site specific trigger values to be used for long-term monitoring during the operation of the sand quarry. An exceedance of a trigger value does not necessarily indicate that there is an unacceptable risk on Site, but rather a trigger for further investigation or evaluation of management options (CRC-CARE Technical Report 10: 2011). **Section 5.8** provides details on the proposed action response should a trigger value be exceeded.

The baseline groundwater and surface water assessment criteria adopted for future quarry extraction works for locations to be monitored under the Sites EPL, and defined in the SWMP, are summarised below. Nationally accepted water quality guidelines; ANZECC (2000) *Australian and New Zealand Water Quality Guidelines for Fresh and Marine Waters, 95% species Protection for freshwater,* HEPA NEMP (2018) *PFAS National Environmental Management Plan* and ADWG (2011) *Australian Drinking Water Guidelines 6,* have been considered in developing Site specific trigger values.

**Table 5.4** and **Table 5.5** presents the proposed trigger values for groundwater and surface water respectively along with a justification for selecting that value. The trigger values are to be applied to the sample locations monitored monthly and quarterly. Locations monitored as part of the annual monitoring should be compared against currently available data for that location only as they have not been considered when developing the trigger values.

#### Table 5.4Site specific trigger values for Groundwater

| Analyte                            | Units       | Adopted Site<br>specific<br>trigger value | Location  | Justification  |
|------------------------------------|-------------|---|-----------|--|
|                                    |             |   |           | Inorganics   |
| pН                                 | pH<br>units | 4 - 7                                     | Site wide | The lowest pH value recorded was 4.37 (noting 4.0 in surface water). It is feasible that pH values could continue to be low. The highest pH value recorded was 6.21 indicating a generally acidic environment. It is therefore unlikely the pH would exceed 7.   |
| Total Phosphorus                   | mg/L        | 2   | Site wide | The majority of baseline results were found to be elevated above the ANZECC 2000 trigger values<br>for a Lowland river in South-east Australia. It is therefore not considered appropriate to use this<br>criterion. The majority of baseline sample results were less than 2mg/L, however it is noted that<br>the highest value recorded was 2.76mg/L at BH3 (noting one sample event and the well is no<br>longer operational) and 2.11mg/L in BH11. The third highest concentration of 1.97mg/L was<br>located at BH8. The sample locations identified represent a large cross section of the Site<br>therefore represent the likely range that could be expected at the Site.  |
| Ammonia as N                       | mg/L        | 0.5                                       | Site wide | The detected range of <0.01-0.34mg/L was not found to be elevated above the ANZECC 2000 and ADWG. Based on the results obtained it is considered that adopting the 0.5mg/L ADWG provides a conservative value for a trigger response. It is noted that the ANZECC criteria is 0.9mg/L.   |
| Total Nitrogen as N                | mg/L        | 3   | Site wide | Results from the majority of locations were generally found to be elevated above the ANZECC 2000 trigger values, with the exception of BH1 where concentrations were recorded to be marginally lower than the initial criteria. The highest concentrations were recorded in BH11 (considered to be up hydraulic gradient of the Site) and BH2 located centrally on Site. Concentrations as high as 2.2mg/L (in BH7) were identified at locations down/ cross hydraulic gradient of the Site. It is evident that concentrations of Nitrogen can be found naturally across the Site and can be varied over time. Concentrations of Total Nitrogen are not expected to be elevated above the highest recorded value of 5.9mg/L. However, to maintain a level of conservatism a trigger value of 3mg/L (half the highest concentration) has been adopted understanding that four previous samples exceeded this value. Elevated concentrations above the adopted trigger value is a requirement to look at the concentration with more detail to determine if it is in line with previous sampling results or considered to be an outlier potentially presenting a significant increase. |
| Electrical Conductivity<br>@ 25°C* | µc/cm       | 125-2200                                  | Site wide | Concentrations across the Site were identified to vary considerably. However, no concentration was found to be elevated above 2200 µc/cm.<br>Trigger criteria has been taken from ANZECC 2000 for a lowland river is south-eastern Australia and is considered appropriate.  |

| Analyte   | Units | Adopted Site<br>specific<br>trigger value | Location   | Justification   |
|-----------|-------|---|--|---|
| Turbidity | NTU   | 6-50                                      | Site wide  | Criteria taken from ANZECC 2000 for a lowland river is south-eastern Australia.   |
|           |       |   |  | Dissolved Metals  |
| Arsenic   | mg/L  | 0.003                                     | Site wide  | Arsenic was not detected within the majority of groundwater locations with the exception of BH8 recording a maximum concentration of 0.003 mg/L. The adopted trigger value has been taken as the maximum value obtained throughout the baseline monitoring period.  |
| Barium    | mg/L  | 0.035                                     | Site wide  | All results for Barium were found to be above the LOR. The highest concentration recorded was 0.034mg/L in BH6 (considered to be up/ cross hydraulic gradient of the Site). The adopted trigger value has been taken to be one significant figure above the highest concentration.  |
| Chromium  | mg/L  | 0.004                                     | Site wide  | All locations recoded concentrations of chromium at or marginally above LOR. Exceedances above initial baseline criteria (ANZECC 2000) were recorded at most locations with the exception of BH4 & BH6. The adopted trigger value has been taken as the maximum value obtained throughout the baseline monitoring period.   |
|           |       | 0.013                                     | Site wide<br>(except BH4)                                | Detections of copper concentrations above LOR were recorded at all locations. The adopted trigger value has been taken as the maximum value obtained throughout the baseline monitoring period.   |
| Copper    | mg/L  | 0.051                                     | BH4  | Concentration range for copper at location BH4 was generally greater than other locations. It is feasible that stormwater runoff from the adjacent Cabbage Tree Road may impact this borehole. Therefore, a higher specific trigger value has been adopted which is the highest concentration identified during the baseline monitoring.  |
| Iron      | mg/L  | 4.1                                       | Northern Half<br>(BH6, BH7,<br>BH8, BH11<br>and MW239S), | The Site can be divided into a northern section and southern section with an access road between<br>the two sections (between BH2 and SW2). The north and south areas are divided by surface water<br>(where SW2 and SW3 are located). Upon review of the groundwater data from the baseline<br>monitoring it appears that there are greater concentrations of iron in the northern area than the<br>southern area.<br>Two separate criteria have been developed based on this. The highest concentration identified<br>during the baseline monitoring for this area has been adopted as the Trigger Value. |
|           |       | 1   | Southern half<br>(BH2, BH4,<br>BH9)                      | The highest concentration identified during the baseline monitoring for this area has been adopted as the Trigger Value.  |

| Analyte   | Units | Adopted Site<br>specific<br>trigger value | Location                         | Justification   |
|---|-------|---|----------------------------------|---|
|   |       |   |                                  | BH1, BH5, BH12 are only proposed to be sampled during the annual monitoring round. When assessing these wells, concentrations will be assessed against previous criteria for those locations.   |
| Manganese   | mg/L  | 0.136                                     | Site wide                        | A similar range of results were identified across all locations. BH4 recorded the highest value of Manganese (0.136mg/L) across the Site. The highest concentration identified during the baseline monitoring has been adopted as the Trigger Value. It is noted that the ANZECC 2000 criteria is 1.9mg/L.  |
|   |       | 0.037                                     | BH11                             | BH11 is located to the north of the Site and is considered to be in an up hydraulic gradient location. The highest concentration identified in BH11 was 0.037mg/L. This has been adopted as the trigger value for this location.  |
| Nickel  | mg/L  | 0.022                                     | Site wide<br>(excluding<br>BH11) | With the exception of BH6 and MW239S, at least one concentration from each monitoring location throughout the baseline monitoring was found to be elevated above than the ANZECC 2000 trigger values. Generally, concentrations of Nickel are similar across the Site (with the exception of BH11). Therefore, the highest recorded value from the baseline monitoring round has been adopted as the trigger value.                                 |
| Zinc  | mg/L  | 0.085                                     | Site wide                        | At least one concentration from each monitoring location throughout the baseline monitoring was found to be elevated above than the ANZECC 2000 trigger values. Generally, concentrations of Zinc are similar across the Site. Therefore, the highest recorded value from the baseline monitoring round has been adopted as the trigger value.<br>Noting that BH1 is not proposed to be sampled until the annual monitoring round where the results |
|   |       |   |                                  | should be assessed against previous results from that location only. TRH  |
| TRH C <sub>6</sub> – C <sub>10</sub>                  | µg/L  | 20  | Site wide                        | Concentrations of TRH were identified to be below the LOR for the majority of the baseline  |
| C <sub>6</sub> - C <sub>10</sub> minus BTEX<br>(F1)   | µg/L  | 20  | Site wide                        | monitoring. The exceptions were following well maintenance work or were observed in BH4 following a high rainfall event. It is feasible that stormwater runoff from the adjacent Cabbage Tree Road may locally impact BH4.  |
| TRH C <sub>10</sub> – C <sub>16</sub>                 | µg/L  | 100                                       | Site wide                        | Based on the understanding of the above, generally TRH is not identified within the groundwater   |
| TRH C <sub>10</sub> - C <sub>16</sub> minus N<br>(F2) | µg/L  | 100                                       | Site wide                        | across the Site. The Laboratory LOR has therefore been adopted as a trigger value.  |
| TRH C <sub>16</sub> – C <sub>34</sub>                 | µg/L  | 100                                       | Site wide                        |   |

| Analyte                               | Units | Adopted Site<br>specific<br>trigger value | Location  | Justification  |
|---------------------------------------|-------|---|-----------|--|
| TRH C <sub>34</sub> - C <sub>40</sub> | µg/L  | 100                                       | Site wide |  |
|                                       |       |   |           | PFAS   |
| PFOS+ PFHxS                           | µg/L  | 0.07                                      | Site wide | Site criteria has been provided in the SWMP. In 2016, Food Standards Australia New Zealand   |
| PFOA                                  | µg/L  | 0.56                                      | Site wide | (FSANZ) were commissioned to develop health-based guidance values for a selection of PFAS.<br>FSANZ (2017) published levels for use in Site investigations which were updated and incorporated<br>into the HEPA NEMP (2018), which was revised in 2019. The HEPA NEMP (2019) is the<br>recognised national guidance for the investigation and management of PFAS in Australia and<br>forms the key guidelines for this SWMP. This has therefore been adopted in this report. |
| PFOS                                  | µg/L  | 0.01                                      | Site wide | Standard LOR has been adopted as the Site wide criteria as it is known that PFAS are widely present in the local area owing to the Red Zone. Ambient concentrations have been detected above this in groundwater emanating from Williamtown RAAF Base.   |

1- National Health and Australian Drinking Water Guidelines 6 (ADWG) (2011) ANZECC (2000) 95% level of species protection in freshwater -

#### Table 5.5 Site specific trigger values for Surface Water

| Analyte          | Units       | Adopted Site<br>specific<br>trigger value | Location  | Justification  |
|------------------|-------------|---|-----------|--|
|                  |             |   |           | Inorganics   |
| рН               | pH<br>units | 4 - 7                                     | Site wide | The lowest pH value recorded was 4.01 in surface water). It is feasible that pH values could continue to be low. The highest pH value recorded was 6.21 indicating a generally acidic environment. It is therefore unlikely the pH would exceed 7.   |
| Total Phosphorus | mg/L        | 0.13                                      | Site wide | The two out of the 10 surface water baseline results were found to be above the ANZECC 2000 trigger values for a Lowland river in South-east Australia. It is therefore not considered appropriate to use this value. The highest recorded value in the surface water was 0.13mg/L in SW1. This value has been adopted as the trigger value for surface water. |
| Ammonia as N     | mg/L        | 0.25                                      | Site wide | The detected range of <0.01-0.16mg/L was not found to be elevated above the ANZECC 2000 and ADWG. Based on the results obtained it is considered that adopting half the 0.5mg/L ADWG value provides a conservative approach for a trigger level. It is noted that the ANZECC criteria is 0.9mg/L.  |

| Analyte                            | Units | Adopted Site<br>specific<br>trigger value | Location  | Justification   |
|------------------------------------|-------|---|-----------|---|
| Total Nitrogen as N                | mg/L  | 1.8                                       | Site wide | Results from the majority of locations were found to be elevated above the ANZECC 2000 trigger criteria. The highest concentrations were recorded in SW1. It is evident that concentrations of Nitrogen can be found naturally across the Site and vary over time. Concentrations of Total Nitrogen are not expected to be elevated above the highest recorded value of 1.8mg/L. Therefore, this has been adopted as the trigger value. |
| Electrical Conductivity<br>@ 25°C* | µc/cm | 125-2200                                  | Site wide | Concentrations across the Site were identified to vary considerably. However, no concentration was found to be elevated above 2200 µc/cm.<br>Trigger criteria has been taken from ANZECC 2000 for a lowland river is south-eastern Australia and is considered appropriate for this Site.   |
| Turbidity                          | NTU   | 6-50                                      | Site wide | Criteria taken from ANZECC 2000 for a lowland river is south-eastern Australia.   |
|                                    |       |   |           | Dissolved Metals  |
| Arsenic                            | mg/L  | 0.001                                     | Site wide | Arsenic was not detected within the majority of groundwater locations with the exception of SW3 recording a maximum concentration of 0.006 mg/L. As the majority of results were recorded below the LOR, the adopted trigger value has been taken as the laboratory LOR.  |
| Barium                             | mg/L  | 0.08                                      | Site wide | All results for Barium were found to be above the LOR. The highest concentration recorded was 0.08mg/L in SW3. The adopted trigger value has been taken to be the highest concentration recorded.   |
| Boron                              | mg/L  | 0.14                                      | SW1       | All results at SW1 for Boron were found to be above the LOR compared to all other locations that had concentrations below LOR. Therefore, a location specific trigger value has been adopted for SW1.   |
|                                    |       | 0.05                                      | SW3 & SW4 | All results were found to be below the LOR. The adopted trigger value has been taken as LOR.  |
| Chromium                           | mg/L  | 0.002                                     | Site wide | The majority of results were found to be below the LOR with one result higher than the ANZECC 2000 trigger value recorded in SW3. The adopted trigger value has been taken as the maximum value obtained throughout the baseline monitoring period.   |
| Cobalt                             | mg/L  | 0.017                                     | Site wide | Detections of Cobalt concentrations above LOR were detected at all surface water locations. The highest concentration was 0.017mg/L in SW1. The adopted trigger value has been taken to be the highest concentration recorded.  |
| Copper                             | mg/L  | 0.013                                     | Site wide | Detections of Copper concentrations above LOR were recorded at all locations. The adopted trigger value has been taken as the same value as the groundwater trigger value. The maximum value obtained in surface water throughout the baseline monitoring period was 0.012mg/L.   |

| Analyte   | Units | Adopted Site<br>specific<br>trigger value | Location  | Justification  |
|---|-------|---|-----------|--|
| Iron  | mg/L  | 9.26                                      | Site wide | The concentrations of Iron identified in the surface water monitoring results were varied and the Mann-Kendal analysis identified a decreasing trend in SW1 and SW3 and no trend in SW4. The highest concentration identified during the baseline monitoring for this area has been adopted as the Trigger Value. Based on the trend analysis it is not expected this value would be exceeded. |
|   | mg/L  | 0.048                                     | SW1 & SW3 | Concentrations of manganese in SW1 and SW3 were found to be similar. The highest concentration identified has been adopted as the trigger value for these locations.   |
| Manganese   |       | 0.841                                     | SW4       | Concentrations of manganese in SW4 were found to be elevated above those in SW1 and SW3. It is feasible that stormwater runoff from the adjacent Cabbage Tree Road may impact this location. Therefore, the highest concentration found in SW4 has been taken as the trigger value.  |
| Nickel  | mg/L  | 0.022                                     | Site wide | Concentrations of nickel in each of the surface water locations was found to be similar. The highest concentration identified in SW1 was 0.02mg/L. This is similar to the trigger value adopted for groundwater; therefore, the same value has been adopted as the trigger value.  |
|   |       | 0.085                                     | SW1 & SW3 | Concentrations of Zinc in SW1 and SW3 were found to be similar. The highest concentration identified has been adopted as the trigger value for these locations.  |
| Zinc  | mg/L  | 0.535                                     | SW4       | Concentrations of Zinc in SW4 were found to be elevated above those in SW1 and SW3. It is feasible that stormwater runoff from the adjacent Cabbage Tree Road may impact this location. Therefore, the highest concentration found in SW4 has been taken as the trigger value.   |
|   |       | _   | _         | TRH  |
| TRH C <sub>6</sub> – C <sub>10</sub>                  | µg/L  | 20  | Site wide | All concentrations of TRH were identified to be below the LOR. The Laboratory LOR has therefore  |
| C <sub>6</sub> - C <sub>10</sub> minus BTEX<br>(F1)   | µg/L  | 20  | Site wide | been adopted as the trigger value.   |
| TRH C <sub>10</sub> – C <sub>16</sub>                 | µg/L  | 100                                       | Site wide |  |
| TRH C <sub>10</sub> - C <sub>16</sub> minus N<br>(F2) | µg/L  | 100                                       | Site wide |  |
| TRH C <sub>16</sub> – C <sub>34</sub>                 | µg/L  | 100                                       | Site wide |  |
| TRH C <sub>34</sub> - C <sub>40</sub>                 | µg/L  | 100                                       | Site wide |  |

| Analyte     | Units | Adopted Site<br>specific<br>trigger value | Location  | Justification  |
|-------------|-------|---|-----------|--|
|             |       |   |           | PFAS   |
| PFOS+ PFHxS | µg/L  | 0.07                                      | Site wide | Site criteria has been provided in the SWMP. In 2016, Food Standards Australia New Zealand   |
| PFOA        | µg/L  | 0.56                                      | Site wide | <ul> <li>(FSANZ) were commissioned to develop health-based guidance values for a selection of PFAS.</li> <li>FSANZ (2017) published levels for use in Site investigations which were updated and incorporated into the HEPA NEMP (2018). The HEPA NEMP (2018), revised in 2019, is the recognised national guidance for the investigation and management of PFAS in Australia and form the key guidelines for this SWMP.</li> <li>This has therefore been adopted in this report.</li> </ul> |
| PFOS        | µg/L  | 0.01                                      | Site wide | Standard LOR has been adopted as the Site wide criteria as it is known that PFAS are widely present in the local area owing to the Red Zone. Ambient concentrations have been detected above this in groundwater emanating from Williamtown RAAF Base.   |

## 5.8 TRIGGER RESPONSE ACTIONS

#### 5.8.1 Metals & Nutrients

The following provides details on the proposed response action required should an analyte concentration be found above the adopted trigger value:

- Review value against previous data including Mann-Kendal trends presented in **Table 4.1** to determine if the concentrations is in line with previous monitoring data, or if considered significantly different then:
  - Question result with the laboratory;
  - Discuss what operations have been undertaken that may cause the elevated concentration; and
  - Review rainfall data and groundwater elevations to establish if concentration is due to seasonal adjustments.
- Re-sample location and elevated metal in the following two monthly monitoring rounds to gauge if the exceedance was an exception of change in trend or characteristic of background changes.

Where the outcome of the above assessment indicates a potential contamination issue then a water trigger investigation should be undertaken in accordance with the SWMP (see **Section 5.8.4**).

#### 5.8.2 Hydrocarbons

The following provides details on the proposed response action required should an analyte concentration be found above the adopted trigger value:

- Question result with the laboratory to determine if there were any laboratory errors;
- Discuss what operations have been undertaken that may cause the elevated concentration;
- Review rainfall data and groundwater elevations to establish if concentration is due to seasonal adjustments; and
- Re-sample location in the following two monthly monitoring rounds to gauge if the exceedance was an exception of change in trend, or characteristic of background changes, and include the following additional analysis:
  - $\circ$  Where TRH C<sub>6</sub> to C<sub>10</sub> has been detected then BTEXN will also be analysed; and/or
  - $_{\odot}$   $\,$  Where TRH C\_{16} to C\_{40} has been detected then PAH will also be analysed.

Where the outcome of the above indicates a potential issue then a water trigger investigation should be undertaken in accordance with the SWMP (see **Section 5.8.4**).

Where a spill or potential pollution incident event has occurred, or the above conversation with the quarry operations indicates a potential contamination issue, then sampling (or re-sampling) at the closest (down hydraulic gradient) location should be undertaken within 48 hours. An incident investigation in accordance with the SWMP must be undertaken.

#### 5.8.3 **PFAS**

Where PFAS is identified above the adopted criteria (or maximum background value detected previously at a specific monitoring location) an additional water sample will be collected within 48 hours and submitted for analysis. In the event the trigger value is exceeded by more than 10% in both the primary sample and the follow-up sample, a water trigger Investigation will be completed to determine if the change is related to:

- The quarry operations;
- External influence; and/or
- Natural variation.

#### 5.8.4 Water Trigger Investigation

Upon triggering the need for a water trigger investigation Hunter Water Corporation (HWC), NSW Environmental Protection Agency (EPA) and Department of Planning Industry and Environment (DPIE) must be notified within 24hours. The SWMP stipulates that the water trigger investigation will evaluate the following:

- A review of the Site conceptual site model to understand the risk potential of the exceedance;
- Identify the potential for other sources to be present that may require confirmatory sampling (and include intrusive investigation if considered appropriate);
- Recent climate and rainfall data;
- Other activities within the catchment (both on and off the Site) in the preceding period;
- Operational activities of the quarry in the preceding period; and
- Historical potential for those quarry activities to cause exceedance.

The water trigger investigation report will be submitted as an incident notification to HWC, EPA and DPIE. The report will also be summarised in the Annual Environmental Review (AER).

# 6. QUALITY ASSURANCE AND QUALITY CONTROL

## 6.1 DATA VALIDATION

The QA/QC program implemented for this monitoring program followed the requirements of the SWMP.

Data Quality Indicators (DQIs) were developed prior to commencing background monitoring and have been summarised in **Table 6.1.** DQIs established acceptable limits for field and laboratory data collected from the monitoring program.

| QA/QC Objective   | Data quality indicator (DQI)  |
|---|---|
| Successful<br>completion of<br>project  | To conduct a baseline water quality sampling program in accordance with NEPM 2013 and AS4482.1 – 1999 in order to achieve the objective set out in <b>Section 1</b> .   |
| Suitable<br>environmental<br>consultant   | The environmental consultant was to maintain QA Systems certified to AS/NZS ISO 9001:2015.  |
| Suitable field<br>personnel   | All Kleinfelder field personnel conducting sampling were to be trained in the requirements detailed in this SWMP. All Kleinfelder field personnel have relevant tertiary qualifications and have demonstrated competence in Kleinfelder procedures for sampling (consistent with NEPM 2013 and AS4482.1 - 1999).                      |
| Adequate sample collection density  | The sampling strategy was developed based on historical information available for the Site and the objective of the investigation.  |
| Standardised<br>sample<br>nomenclature  | All samples were labelled with a unique identifier that can be related to sample location.<br>Surface water and Groundwater samples were labelled as per monitoring well ID. The<br>following naming convention was utilised:<br>Bore Hole (BH) – Number (1, 2, 3):<br>E.g. MW1<br>Surface water (SW) – Number (1, 2, 3):<br>E.g. SW1 |
| Decontamination of field equipment  | When sampling equipment was used, nitrile gloves were worn and changed between locations. Non-dedicated sampling equipment was decontaminated between sample locations using an appropriate surface-active cleaning agent (e.g. Liquinox for use with PFAS) as consistent with NEPM 2013 and HEPA NEMP (2019).                        |
| Calibration of field<br>instruments   | All field instruments were calibrated prior to use, and the calibration certificates have been provided in Appendix C .   |
| Transportation  | A Chain of Custody (COC) document was used to ensure the integrity of the samples from collection to receipt by the analytical laboratory within appropriate holding times.   |
| National<br>Association of<br>Testing Authorities<br>(NATA) accredited<br>laboratory analysis | <ul> <li>All samples were forwarded to a laboratory holding NATA accreditation for the required analyses.</li> <li>The following Laboratories were utilised: <ul> <li>ALS – Primary Laboratory for chemical analysis; and</li> <li>Eurofins – Secondary Laboratory for chemical analysis.</li> </ul> </li> </ul>                      |

 Table 6.1
 QA/QC data quality indicators

| QA/QC Objective  | Data quality indicator (DQI)   |
|--|--|
| Field QA/QC  | Duplicate samples (intra-laboratory) were collected at a rate of one in every twenty (1:20) primary water samples and submitted to the primary laboratory for analysis. Standard NEPM 2013 duplicate and triplicate requirements were deemed reasonable for the sampling of PFAS for the purpose of baseline water monitoring. Triplicate samples (inter-laboratory) were also collected at a rate of one in every twenty (1:20) primary water samples and submitted to the secondary laboratory for analysis. Field duplicate and triplicate samples are used to assess field and analytical precision and the precision measurement is determined using the relative percent difference (RPD) between the primary sample (X1) and duplicate sample (X2) results, as shown in the following equation: |
|  | Relative percent difference (RPD) = $(X1 - X2) \times 100$   |
|  | (X1 + X2)/2<br>Generally, it is recommended that RPD is <30% (NEPM 2013).  |
|  | Default RPD levels in the field may be non-compliant for the following reasons:  |
|  | <ul> <li>The differing laboratory equipment, procedures and limits of reporting (between the primary and secondary laboratories);</li> <li>Due to sample matrix interference; and/or</li> </ul>  |
|  | <ul> <li>Due to the reported concentrations being close to the limit of reporting where<br/>laboratory precision and accuracy are inherently low.</li> </ul>   |
|  | A rinsate blank sample was collected for each piece of non-dedicated sampling equipment per day onsite and submitted to the primary laboratory for analysis.   |
|  | A transport blank sample was collected for each batch of samples sent to the laboratory (~one per day in the field) and submitted to the primary laboratory for analysis for each day samples are taken.   |
|  | QA/QC non-compliance was documented and discussed in the monthly summary letter (see <b>Appendix B</b> ). Where exceedances were identified (i.e. duplicates and triplicates be above the RPD or rinsate blanks, field blanks or transport blanks be above the LOR) then consideration was given to the sample(s) being re-analysed, the higher concentration level to be conservatively adopted and/or reviewing field practices for continued prevention of potential cross contamination.   |
| Laboratory Quality   | Laboratory QA/QC acceptance limits are as follows:   |
| Control –<br>Duplicates, spikes,<br>blanks and<br>surrogates – | Surrogates: 70% to 130% recovery;<br>Matrix Spikes: 70% to 130% recovery for organics or 80% to 120% recovery for<br>inorganics;   |
| Acceptable Limits  | Control Samples: 70% to 130% recovery for soil or 80% to 120% recovery for waters;<br>Duplicate Samples: <4 Practical Quantitation Limits (PQL) - +/- 2PQL, 4-10PQL – 025<br>or 50%RPD, >10PQL – 0-10 or 30%RPD; and   |
|  | Method Blanks: zero to <pql.< td=""></pql.<>   |

## 6.2 QA/QC RESULTS

#### 6.2.1 Field Method Validation

To ensure the completeness, comparability, representativeness, precision and accuracy of QA/QC items, **Table 6.2** details how the QA/QC compliance has been met.

| Table 6.2 | Field QA/QC |
|-----------|-------------|
|-----------|-------------|

| QA/QC Objective                     | Data Quality Indicator (DQI)   |
|-------------------------------------|--|
| Suitable field<br>personnel         | The Site work was undertaken by Dan Kousbroek who has 4 years' experience in contaminated land investigations. Dan was informed of the requirements of the agreed scope of works. Dan has relevant tertiary qualifications and has demonstrated competence with Kleinfelder's sampling procedures (consistent with NEPM 2013 requirements and AS4482.1 2005).                    |
| Adequate sample collection density  | Water sampling was undertaken based on information provided in the SWMP.<br>A targeted sampling program was undertaken requiring sampling at 10 groundwater<br>locations and 4 surface water locations and then analysed. It is noted that a number of<br>the surface water locations were found to be dry throughout the 12 months due to an<br>extended drought period in NSW. |
| Field equipment                     | YSI 556 Water Quality Meter and Solinst oil/water interface meter were used during field works.  |
| Calibration of field<br>instruments | Calibration certificates for each piece of equipment used in the field are attached in Appendix C  |
| Sample<br>preservation              | Samples were collected in laboratory supplied containers and immediately stored in an insulated esky chilled with ice.   |
| Sample handling                     | Samples were delivered straight to ALS Newcastle following each sampling event.<br>Chains of custody are included in Appendix A of the monthly reports, which have been<br>provided as <b>Appendix B</b> of this document.   |

#### 6.2.2 Laboratory QA/QC

The results for internal laboratory QA/QC procedures are provided within the laboratory analysis reports (Appendix A of the monthly reports, which have been provided as **Appendix B** of this document). **Table 6.3** summarises conformance to specific QA/QC procedures, also see **Tables E, F** and **G** at the rear of this report for a summary of the data.

| Quality assurance   | Conformed | Comment  |
|---|-----------|--|
| Collection of rinsate water<br>from decontaminated field      | Yes       | Rinsate was sourced from a NATA accredited laboratory and supplied with the sample containers.   |
| equipment   |           | A rinsate sample was taken from the sampling equipment<br>during each sampling event. A total of 12 rinsate samples were<br>taken. All samples were non detect.  |
|   |           | See Tables E, F and G at the back of this report.  |
| Collection of transport<br>blanks through the sampling<br>day | Majority  | 12 transport blank samples were collected (two samples in March (due to a return confirmatory sampling event), no transport taken in August 19)  |
|   |           | 2 <sup>nd</sup> transport blank taken in March (15/03/19) was found to contain barium (2ug/l). As no other transport blanks were found to have concentrations above LOR and the following months samples resulted in non detect the data is considered reliable. |
|   |           | See Tables E, F and G at the back of this report.  |
| Holding times met   | Yes       | Holding times were met for all analytes and samples.   |
|   |           | Every effort was made by Kleinfelder to deliver samples to the laboratory as soon as possible after sampling.  |

Table 6.3Laboratory QA/QC

| Quality assurance   | Conformed | Comment  |
|---|-----------|--|
| LOR less than assessment criteria   | Yes       | Majority of LOR were below the adopted screening criteria.<br>Adopted criteria for PFOS (HEPA NEMP 2018) is below LOR. It<br>is noted that PFAS are likely to be in the region given the<br>reported scale of PFAS in groundwater within the Red Zone,<br>therefore the standard LOR has been adopted.   |
| All analyses National<br>Association of Testing<br>Authorities (NATA)<br>accredited                           | Yes       | All samples were delivered to a NATA accredited laboratory for<br>the required analysis, within specified holding times. The<br>primary laboratory used was ALS (delivered to the Newcastle<br>laboratory). Triplicate samples were forwarded by ALS to the<br>secondary laboratory, Eurofins mgt (Newcastle).   |
| Field intra-laboratory<br>duplicate samples collected<br>and analysed to represent<br>5% of sample population | Majority  | One intra-laboratory duplicate sample and one inter-laboratory<br>triplicate water sample were collected. This is considered to<br>exceed the requirement of 5% of the total number of primary<br>analyses undertaken (minimum 1 in 20 duplicate and 1 in 20<br>triplicate samples).<br>Due to a laboratory error in transferring samples, one intra-<br>laboratory triplicate (March 2019) was only sampled for Metals<br>and PFAS with TRH and BTEX being missed from the COC to<br>the tertiary laboratory. With the exception of some minor<br>elevations of TRH and BTEX which were attributed to<br>maintenance work on the well, there were no recorded<br>concentrations above LOR. Therefore, this is not considered to<br>impair the reliability of data in meeting the objectives of this<br>monitoring programme.<br>See <b>Table 6.5</b> for details.   |
| Did duplicate sample meet<br>RPD requirements   | Majority  | <ul> <li>The majority of samples met the RPD requirements of being within 30% (See Tables E, F and G at the back of this report). The following did not meet these requirements:</li> <li>Arsenic – 67% BH8 (Feb 2019)</li> <li>Cobalt – 40% BH7 (March 2019)</li> <li>Copper – 190% SW4 (September 2019)</li> <li>Lead – 67% SW4 (September 2019)</li> <li>Nickel – 140% SW4 (September 2019), 67% BH6 (January 2020)</li> <li>Zinc – 100% BH8 (February 2019), 151% SW4 (September 2019)</li> <li>In general, for these exceedances at least one sample was found to be below or close to the Laboratory LOR, which leads to exaggerated RPD calculations. In order to take a conservative approach, the highest recorded concentration has been selected for results screening. These RPD exceedances are therefore not considered to have a negative impact on the outcome of the assessment.</li> </ul> |
| Did triplicate sample meet<br>RPD requirements  | Majority  | <ul> <li>The majority of samples met the RPD requirements of being within 30% (See Tables E, F and G at the back of this report). The following did not meet these requirements:</li> <li>Water:</li> <li>Arsenic – 67% BH8 (February 2019)</li> <li>Chromium – 86% BH8 (February 2019), 67% SW3 (June 2019)</li> <li>Cobalt – 40%</li> <li>Copper – 190% SW4 (September 2019), 156% BH6 (January 2020)</li> </ul>   |

| Quality assurance                 | Conformed | Comment   |
|-----------------------------------|-----------|---|
|                                   |           | <ul> <li>Lead – 67% SW4 (September 2019)</li> <li>Nickel – 156% BH7 (March 2019), 140% SW4 (September 2019), 111% SW4 (November 2019)</li> <li>Zinc – 113% BH7 (March 2019), 151% SW4 (September 2019), 172% SW4 (November 2019) &amp; 131% BH6 (January 2020)</li> <li>PFOS – 100% SW4 (September 2019)</li> <li>Sum of PFHxS and PFOS – 100% (September 2019)</li> <li>Sum of PFAS (WA DER List) – 86% (September 2019)</li> <li>Sum of PFAS – 133% (September 2019)</li> <li>A number of exceedances were calculated with one sample being below the Laboratory LOR. This leads to a potentially exaggerated RPD calculations. In order to take a conservative approach, the highest recorded concentration has been selected for results screening.</li> <li>RPD exceedances for triplicates can often be attributed to differences in methods used by each of the labs and are not considered to impair the reliability of the data in meeting the objectives of this monitoring programme.</li> </ul> |
| Internal laboratory<br>procedures | Majority. | Holding time breaches are discussed above.<br>Internal laboratory QC procedures were generally met. Some<br>exceedances of internal procedures for laboratory duplicates<br>and matrix spikes were recorded for water samples, for organic<br>analysis. However, the primary laboratory results recorded<br>these analytes to be below the LOR. Therefore, this does not<br>impair the reliability of the analytical data for decision making.<br>This is not considered to impact the outcome of the results and<br>thus unlikely to impair the outcome of decision making.  |

A summary of the water sample container types, preservation and the order of container filling is provided in **Table 6.4**.

| Table 6.4 | Container types, | preservation an | d order of filling |
|-----------|------------------|-----------------|--------------------|
|           |                  |                 |                    |

| Analyte  | Container Type  | Preservation                 |

#### Table 6.5 Summary of groundwater QC program

Bold: Indicates not meeting the triplicate density.

## 6.3 QUALITY STATEMENT

Field sampling procedures conformed to Kleinfelder's QA/QC protocols to prevent cross contamination, preserve sample integrity and allow for collection of a suitable data set from which to make technically sound and justifiable decisions with data of satisfactory useability.

Based on a review of the results for the Kleinfelder and laboratory QA/QC program adopted, the overall data quality is considered to be suitably reliable and representative of groundwater conditions beneath the Site. Copies of the final NATA endorsed laboratory reports, including internal QA/QC results and chain-of-custody documentation for the primary and secondary laboratories are attached as Appendix A of the monthly reports, which have been provided as **Appendix B** of this document.

### 6.4 EQUIPMENT CALIBRATION

All equipment used was supplied calibrated with appropriate calibration certificates (see **Appendix A**). Kleinfelder undertook pre-mobilisation checks of equipment (including calibration as required). Prior to commencing field operations, the following equipment and calibration checks were conducted:

- Water Quality Meter The water quality meter came calibrated from the supplier. A daily confidence check of dissolved oxygen, pH and EC was undertaken using air and standards of known concentration, and calibration performed as warranted.
- **PID** the PID came calibrated from the supplier. A daily fresh air calibration check was undertaken on Site.

# 7. SUMMARY STATEMENT

A baseline water monitoring program was conducted at the Site to characterise groundwater and surface water for ongoing use of the Site as an operational sand quarry from February 2019 through to January 2020.

The analytical results indicate that metals, namely barium, chromium, copper, iron manganese, nickel and zinc, were detected regularly throughout the monitoring period, and at the majority of the sample locations, indicating likely natural background concentrations. Iron concentrations were typically higher at BH1 throughout the baseline monitoring program which are likely indicative of concentrations in this area.

BTEXN, TPH and TRH were generally not detected across the majority of the Site with the exception of BH1 and BH4. At the initiation of the baseline sampling program in February 2019 BH1 was refitted with a PVC pipe to replace a previously fire damaged one. In the process an acrylic adhesive was applied to fuse the pipes together which likely initiated increased concentrations of TPH C<sub>6</sub> - C<sub>9</sub> (1,710 $\mu$ g/L) and TRH C<sub>6</sub> - C<sub>10</sub> (1,690 $\mu$ g/L) within the well. The subsequent months following reinstallation of the well concentrations of TPH and TRH fell to below LOR. Concentration of hydrocarbons detected at BH4 are most likely influenced by the adjacent Cabbage Tree Road. Concentrations were detected following some form of rainfall in the region and ongoing detections are likely given the location of BH4 being in close proximity to a relatively busy carriageway. Ongoing monitoring of hydrocarbons is recommended, for due diligence purposes, given the potential likelihood for spills to occur from operational vehicles.

PFAS detections above LOR were recorded at locations BH4, BH6 and SW4. Concentrations of PFAS identified at BH6 and SW4 are likely sourced from an upgradient source from the Site, namely the Williamtown RAAF Base where historical use of PFAS containing materials have been used. PFAS identified at location BH4, and directly adjacent to Cabbage Tree Road, is likely to have occurred from a different historical source. Ongoing monitoring of PFAS should be undertaken directly following initial excavation works.

It should also be noted that the Site and regional area has experienced a significant drought over the past couple of years and this may have a bearing on groundwater and surface water conditions should significant rainfall reoccur in the region. Baseline data provided within this report should be reassessed following a full year of data with average to above average rainfall to identify potential outliers that may be present.

**Table 7.1** provides a summary of the proposed ongoing operational monitoring schedule for

 the Site (however we understand that DPIE has requested Site to make minor modifications

to the below program e.g. monthly PFAS monitoring). **Table 7.2** provides a summary of the proposed testing schedule for the different monitoring events and presents the adopted groundwater (GW) and surface water (SW) trigger values.

| Location                                    | Monthly      | Quarterly    | Annually     |
|---|--------------|--------------|--------------|
| BH2, BH4, BH6, BH7, BH9, BH11 and<br>MW239S | $\checkmark$ | $\checkmark$ | ~            |
| BH8<br>SW1, SW2, SW3, SW4                   |              | $\checkmark$ | ~            |

# **1. INTRODUCTION**

## 1.1 BACKGROUND

Kleinfelder Australia Pty Ltd (Kleinfelder) was engaged by Williamtown Sand Syndicate (WSS) to undertake a 12 month surface water and groundwater monitoring program to establish baseline conditions at the Newcastle Sands quarry site, 298 Cabbage Tree Road, Williamtown, New South Wales (NSW) (the 'Site'). The Site is located approximately 12 km north east of Newcastle at Williamtown, NSW. The location of the Site is depicted on **Figure 1** and the site layout is presented in **Figure 2**.

Monitoring was undertaken to satisfy the requirements of the Soil and Water Management Plan (SWMP) (KLF, 2019) and Environmental Protection Licence 21264 (EPL). It is noted that the SWMP is a sub-plan within the overarching 'Newcastle Sands Quarry Environmental Management Plan' (June 2018), referred to herein as the EMP.

Groundwater and surface water monitoring was conducted over 12 consecutive months from February 2019 through to January 2020 and was generally completed between the 11<sup>th</sup> and 18<sup>th</sup> of each month. A Sampling Plan was prepared and presented in the SWMP, covering an appropriate methodology and quality control requirements for the monitoring program (see **Section 3** for further details).

The Sampling Plan was designed to obtain representative background data on water flow and quality in surface water bodies and groundwater that has the potential to be impacted by the site operations, or unrelated off-site sources. The SWMP identifies that, unless amended, the ongoing surface water and groundwater monitoring program will be consistent with the baseline water quality program.

## 1.2 PURPOSE OF THE BASELINE SUMMARY REPORT

The SWMP identifies that on completion of the baseline monitoring program, the following parameters would be reviewed and advise ongoing monitoring requirements including:

- Location of sampling points, e.g. more suitable / representative location identified, or sampling location has insufficient water to accurately monitor development.
- The frequency of the sampling may be reduced, or increased, depending on the fluctuations in the results.
- The parameters may be adjusted to remove superfluous analytes and/or add additional analytes.

## **1.3 OBJECTIVES**

The objectives of the monitoring program were to:

- Establish background groundwater and surface water conditions across the Site;
- Establish site specific trigger values to be used during the operation of the quarry whereby concentrations outside these trigger values need to be reviewed in more detail; and
- Develop an ongoing sampling program (frequency and analysis) that will maintain compliance with the conditions of the EPL and EMP.

# 1.4 SCOPE OF WORK

The following provides the scope of work to deliver the baseline water quality summary report:

- Review and present site characteristic information;
- Provide an assessment of quality assurance (QA) and quality control (QC) undertaken over the 12-month period and validate the data;
- Provide a summary of the water quality identified across the site including:
  - Field observations;
  - Analytical results; and
  - Trend analysis;
- Establish trigger values for review against ongoing sampling; and
- Propose an ongoing monitoring programme to be conducted during operations that will maintain compliance with the EMP and EPL.

The scope of work for each of the background monitoring rounds can be seen in the monthly summary reports.

# 2. SITE CHARACTERISTICS

## 2.1 SITE IDENTIFICATION DETAILS

Table 2.1 provides site-specific identification details.

| Site address                            | 298 Cabbage Tree Road Williamtown, NSW.  |
|---|--|
| Site name                               | Newcastle Sands Quarry.  |
| Current Title<br>identification details | <ul> <li>Four titles within the Parish of Stockton, County of Gloucester including:</li> <li>Lot 1 DP 224587 at 398 Cabbage Tree Road, Williamtown</li> <li>Lot 121 DP 556403 at 282B Cabbage Tree Road, Williamtown.</li> <li>Lot 11 DP 629503 at 282A Cabbage Tree Road, Williamtown.</li> <li>Lot 1012 DP 814078 at 282 Cabbage Tree Road Williamtown</li> </ul>            |
| Current land use                        | Currently the Site comprises mostly native vegetation. Initial quarry works have progressed to include pre-works hardstand areas and administration buildings.   |
| Site total area                         | Total Project Area of approximately 42.3 hectares from a Subject Land Area of approximately 176.2 hectares.  |
| Current ownership                       | Port Stephens Shire Council under lease to Williamtown Sand Syndicate Pty Ltd.   |
| Current land use<br>zoning              | The site is currently RU2 – Rural Landscape (Port Stephens LEP 2013).  |
| Local government                        | Port Stephens Council.   |
| Proposed site use                       | Sand quarry extracting up to 530,000 tonnes per annum over a period of 6 to 15 years including the construction of an intersection with Cabbage Tree Road, sealed and gravel access roads, site office, workshop and weighbridges.<br>Progressive rehabilitation of quarried land returning to native vegetation communities with potential future use of the facilities area. |

#### Table 2.1 Site details

## 2.2 CURRENT LAND USE

The Site currently has a workshop, office area comprising of demountable buildings, gravel aggregate hardstand areas for transitioning vehicles and future sorting. The areas surrounding the immediate vicinity of the Site comprise predominantly natural vegetation with exception to a gravel road, two former silica sand extraction areas and the verge of Cabbage Tree Road.

## 2.3 FORMER LAND USE

The Project Area consists predominantly of native vegetation, with some previously cleared areas present in the eastern part of the site. Approximately 48 ha of the 176.2 ha site was previously disturbed by heavy mineral sand mining and associated activities that were undertaken on the site between 1970s and late 1990s. This disturbance included areas that were dredged as part of extracting heavy minerals, sand borrow pits, settling ponds, monazite trenches and access roads.

In March 2002, Port Stephens Council (PSC) purchased four allotments comprising the project area (398, 282B, 282A and 282 Cabbage Tree Road Williamtown) from Rutile and Zircon Mines and was subsequently used for cattle adjustment. In 2012 PSC sought tenders from interested parties for the extraction of sand from the project area.

## 2.4 SURROUNDING LAND USE

The Williamtown RAAF base is located 2.5 km to the north east, with Fullerton Cove approximately 600 m to the south and the Hunter River estuary beyond (**Figure 1**).

Residential dwellings are located to the east (closest dwelling is 244 m), south (closest dwelling is 61 m) and west (closest dwelling is 83 m) of the Site. Most are small properties utilised as hobby farms (e.g. keeping horses and chickens), some are larger and also graze livestock. Potable water for dwellings is likely to comprise primarily reticulated water from Hunter Water network and rainwater. Many properties appear to have spear point wells installed for stock and domestic use. No dwellings are located within 4 km north of the Site.

## 2.5 GEOLOGY

Review of the Newcastle 1:250,000 series geological map (Sheet S1 56-2, 1966) indicates that the site is underlain by Quaternary aged marine and freshwater deposits comprising gravel, sand, silt, clay and "Waterloo Rock".

The majority of the Site is located above the Tomago Sandbeds. The Tomago Sandbeds were formed during the Pleistocene era with the original sand deposits occurring up to 250,000 years ago. Rising sea levels created a large bay extending from Newcastle to Port Stephens. The Hunter and Karuah Rivers both flowed into the bay and deposited large volumes of sand. A combination of wave and wind action spread the sand along the coastline and formed the series of shallow dunes that make up the Tomago Sandbeds (Hunter water website 15/08/2018).

The sand dunes consist of a layer of highly permeable fine-grained sands underlain by impervious clay and rock. The thickness of the sand layer reaches a maximum of 50 metres, but on average is 20 metres deep (Hunter Water website 15/08/2018).

The North Stockton Sandbeds, which form the current coastline between Newcastle and Port Stephens, were deposited much more recently than the Tomago Sands. They overlie the eastern extremity of the Tomago Sands and were deposited in the Holocene era (10,000 years ago) (Hunter water website 15/08/2018).

## 2.6 HYDROLOGY & HYDROGEOLOGY

### 2.6.1 Surface Water

The high permeability of the Tomago Sandbeds result in little or no defined surface runoff, noting no defined natural drainage lines are on the site. Drainage is therefore predominantly via vertical infiltration into the sand, with any ephemeral surface drainage generally expected to be in the direction of the existing surface slopes.

In the area around the Site, the Tomago Sandbeds are located on the edge of low lying (about 2-3 m AHD) Holocene aged freshwater and alluvial and estuarine swamps deposits. These low-lying areas adjoining the Site are frequently waterlogged during high rainfall, due to increasing and shallow groundwater levels and a shallow groundwater gradient that slows the percolation of surface water. It is likely that the majority of accessible surface water onsite is an expression of groundwater, typically created through man made excavation.

The western portion of the southern and norther resources areas theoretically drain to the west, while the dominant surface drainage direction for most of the Site is to the east (i.e. Catchments 2 and 3 above). Here the landform drops from the edge of the resource area around 5 m AHD to the swamp or flats over a relatively short distance with the gradient reaching up to 16%. The swamp areas have a gradient of approximately 0.1% with the elevation falling 1.5 m over the 1100 m to the eastern boundary of the Subject Land with water conveyed by an open constructed channel (in middle of Catchment 3).

From the eastern boundary of the Site, drainage is directed via constructed channels through to Dawsons Drain and the northern extent of Fullerton Cove where the elevation drops 1 m over 1900 m (with an average gradient of 0.05%).

For the south eastern portion of the Project area, a portion of the resource area has the potential to drain south east across the Subject Land to a culvert beneath Cabbage Tree Road (Catchment 4). In this area the landform drops at about 14% to the swamp or flats that then appears to have a very slight gradient to the south eastern corner of the site (i.e. less than 0.5 m over at least 140 m). From this point the area drains via series of constructed channels through to the Ring Drain, a large constructed channel around the northern extent of Fullerton Cove over a distance of 590 m with an average gradient of less than 0.4%. Inspection of the site shows this culvert is only likely to flow during periods of extended rainfall and a high-water table.

Cabbage Tree Road has been built up during its construction, with shallow table drains constructed partially along the northern side of the road and deeper drains constructed partially

along the southern side. The nearest culvert is located at the eastern extent of the subject land, approximately 80 m beyond the proposed road construction area.

Following quarrying at the site the catchments will progressively change with Catchment 3 increasing in size with water from within the quarry footprint (currently draining west) directed south east into Catchment 3 (i.e. Catchment 1 will drain to Catchment 3). However, given the high permeabilities it is highly unlikely that any changes in flow would be realised across the site.

### 2.6.2 Groundwater

The Site is located on highly permeable Pleistocene Tomago Sandbeds (sand dunes). The source of the water within the Tomago Sandbeds is rainfall that lands directly on the sand surface. While a proportion of the rainfall is lost to plants and evaporation, sufficient water is stored in the sand to provide a viable and significant source of water for ongoing extraction. Over time rainfall landing on the sandbeds has washed out any remnants of sea salt leaving the deep sand system full of fresh water (Hunter Water website 15/08/2018).

A previous groundwater investigation was undertaken by RCA Australia (RCA Australia, 2015), groundwater was encountered on the Site ranging from 0.67 m below ground level (mbgl) to 15.65 mbgl. Groundwater when at its highest is visible at or near the surface for land below 3 m AHD. Groundwater at the Site has a low hydraulic gradient and was interpreted to flow in a general southerly to south-easterly direction, towards Fullerton Cove (RCA Australia, 2015) from Grahamstown Dam in the north toward Fullerton Cove in the south, the groundwater gradient within the local area is less than 0.2%.

The northern portion of the Site is located within the Hunter Water Special Area, owing to the presence of the Tomago Sandbeds and their use for a portion of the lower Hunter's drinking water supplies.

The Project area and extent of extraction has been designed such that sand extraction remains a minimum of 0.7 m above the highest predicted groundwater level, with the final landform to be established at no less than 1 m above the highest predicted groundwater level (about 2 m above the average level).

# 3. BACKGROUND MONITORING PROGRAM

## 3.1 SAMPLING PLAN

The SWMP required monthly sampling to be undertaken over a 12-month period to characterise background groundwater and surface water conditions throughout the site.

10 groundwater (BH1, BH2, BH4, BH6, BH7, BH8, BH9, BH10, BH11 and MW239S) and 4 surface water (SW1, SW2, SW3 and SW4) locations were sampled throughout the 12 monitoring rounds as outlined in **Figure 2**. The remaining site wells (BH3, BH12, MW239D and BH5) were used to provide additional groundwater elevation data.

Each monitoring event included sampling for:

- General water quality parameters: (Calcium (Ca), Magnesium (Mg), Sodium (Na), Potassium (K), pH, Electrical Conductivity (EC), Chloride (CI), Sulphate (SO<sub>4</sub>), Alkalinity, Hardness & Total Dissolved Solids (TDS) (Calc')),
- Total Recoverable Hydrocarbons (TRH),
- Total Petroleum Hydrocarbons (TPH),
- Benzene, Toluene, Ethylbenzene, Total Xylenes, Naphthalene (BTEXN),
- Metals (Arsenic (As), Boron (B), Barium (Ba), Beryllium (Be), Cadmium (Cd), Chromium (Cr), Cobalt (Co), Copper (Cu), Iron (Fe), Lead (Pb), Manganese (Mn), Mercury (Hg), Nickel (Ni), Selenium (Se), Vanadium (V), Zinc (Zn)); and
- PFAS including Perfluorooctane sulfonate (PFOS), Perfluorooctanoic acid (PFOA), Perfluorohexanesulfonate (PFHxS) & perfluorodecane sulfonic acid (PFDS).

The baseline sampling program also included an initial sampling round and quarterly monitoring where additional analysis was included for an extended water quality suite (including hardness, Nitrate, Nitrite, Ammonia, Reactive Phosphorous, Total Nitrogen and TKN). Some additional groundwater monitoring locations were also included in quarterly monitoring as identified in **Table 3.1**.

1: Sample locations were dry

\* Shaded months indicate quarterly sampling suite

Following each monitoring round, a monthly factual letter report was prepared (see **Appendix A**). Each report presented:

- The field observations and field data;
- The results of the laboratory analysis;
- A comparison of the results against industry guidelines; and
- Rainfall data from the preceding month.

## 3.2 FIELD OBSERVATIONS

### 3.2.1 General

Surface water and groundwater monitoring was initiated in February 2019 and continued each month for a duration of 12 months until January 2020. Sampling times were generally consistent, undertaken each time within the middle of the month (between the 11<sup>th</sup> and 18<sup>th</sup> of the month). Within the first two monitoring rounds (February and March) re-insertion of PVC piping was required at fire effected location BH1 and for root bound effected location BH12. Site works, focussing on initial site infrastructure and access roads, began in October 2019 in preparation for the proposed quarry extraction works which are expected to initiate from early to mid 2020.

### 3.2.2 Monitoring Location Observations

Groundwater and surface water observations made during gauging and sampling at monitoring locations BH1, BH2, BH3 BH4, BH6, BH7, BH8, BH9, BH10, BH11, MW239S, SW1, SW2, SW3 and SW4 are summarised below. Conditions at each location were generally consistent throughout the monitoring period with the exception of surface water which provided intermittent periods of accessible water throughout the monitoring program.

Sensory observations of visual and olfactory quality were made on groundwater and surface water during sampling. A summary of these observations is presented in **Table 3.2** below.

| Location            | General Observations  |
|---------------------|---|
| BH1                 | Generally, slightly cloudy brown with occasional sulfur odour. Well was reinstated in<br>February 2019 following fire damage. The month following reinstatement an acrylic odour<br>was detected which was most likely a bonding material used to fuse the PVC well piping<br>together.                 |
| BH2 <sup>1</sup>    | Mostly dark brown in colour with a silty material at the base of well. A slight sulfur odour was evident throughout the monitoring period.  |
| BH3                 | Prior to well decommissioning in September 2019 due to initial site works, observations o groundwater were identified as light brown with no odour. Well base contained fine silty material. No samples were taken following initial sampling round in February 2019.                                   |
| BH4 <sup>1</sup>    | Generally light brown in colour with slight sulfur odour.   |
| BH5                 | Generally light brown with no apparent odour. No samples taken throughout the monitoring program, only gauging.   |
| BH6 <sup>2</sup>    | Generally, light brown in colour with a slight sulfur odour.  |
| BH7 <sup>1</sup>    | Generally, light to moderately brown in colour with a slight sulfur odour.  |
| BH8                 | Generally, brown to dark brown in colour with a moderate sulfur odour.  |
| BH9 <sup>1</sup>    | Well was dry for the duration of the baseline monitoring program.   |
| BH10                | Well was dry for the duration of the baseline monitoring program.   |
| BH11 <sup>2</sup>   | Generally, cloudy light brown with a moderate sulfur odour.   |
| BH12                | Well was reinstated in March 2019 following inundation of roots into the well. A 40mm inner PVC pipe was installed. The months following reinstatement of a well an acrylic odour was detected which was most likely a bonding material used to fuse the PVC well piping together. No sample was taken. |
| MW239S <sup>1</sup> | Cloudy dark brown in colour with a moderate sulfur odour.   |
| MW239D              | Cloudy dark brown in colour with a moderate sulfur odour. No sample was taken.  |
| SW01                | Intermittent periods of pooling at monitoring location. Water is generally stained with natural tannins, dark brown with a slight sulfur odour.   |
| SW02                | Monitoring location was observed to be dry for the duration of the baseline monitoring program.   |
| SW03                | Water mostly clear with no apparent odour. Often water was stagnant and at times dry.   |
| SW04                | Water mostly clear with no apparent odour. Often water was stagnant and at times dry.   |

3 – No sampling undertaken

4 - Surface water levels (mm) identified from measured stake at each location (When dry number is ground elevation AHD)

## 3.3 GROUNDWATER AND SURFACE WATER ANALYSIS

### 3.3.1 Industry guidelines

In order to understand background surface and groundwater quality in relation to published data, laboratory results were compared against trigger values found in industry guidelines as outlined in the SWMP.

An exceedance of any adopted trigger value does not necessarily indicate that there is an unacceptable risk on site (CRC-CARE Technical Report 10: 2011), but rather identifies the need to explore the results in more detail. For this report we are reviewing natural background conditions and this comparison identifies the quality of the natural conditions indicative of this area.

The following industry guidelines have been used:

- Australian and New Zealand Environment and Conservation Council (ANZECC) & Agriculture and Resource Management Council of Australia and New Zealand (ARMCANZ), Water Quality Guidelines for Fresh and Marine Water Quality 95% species protection for fresh water (ANZECC 2000);
- The Heads of Environmental Protection Authorities in Australia and New Zealand (HEPA) Per- and polyfluoroalkyl substances (PFAS) National Environmental Management Plan (NEMP 2018); and
- Australian Drinking Water Guidelines 6 (ADWG) (2011).

### 3.3.2 Summary of results

Summary tables outlining the analytical data obtained from the Baseline Monitoring Program, and a comparison against trigger values are provided within the **Tables** section at the rear of this report. **Table 3.4** below provides a summary of groundwater and surface water concentrations as a range (minimum to maximum) for all analytes across the Site.

An assessment of Kleinfelder's Quality Assurance and Quality Control (QA/QC) processes and procedures has been provided in **Section 6**. Laboratory Certificates of Analysis (COA) including laboratory QC reports are presented as Appendix A of the monthly reports, which have been provided as **Appendix B** of this document.

4 – HEPA NEMP 2018 Recreation Water

# 4. BASELINE WATER QUALITY ASSESSMENT

## 4.1 METALS

Elevated concentrations of chromium above trigger values (ANZECC 2000) were recorded at monitoring locations BH1, BH2, BH3, BH7, BH8, BH11, MW239S and SW3. Concentrations ranged from <0.001mg/L - 0.004 mg/L for groundwater and from <0.001 – 0.002 mg/L for surface water.

Elevated concentrations of copper above trigger values (ANZECC 2000) were recorded at monitoring locations BH1, BH2, BH4, BH6, BH7, BH8, BH11, MW239S, SW1, SW3 and SW4. Concentrations ranged from <0.001mg/L - 0.051 mg/L for groundwater and from <0.001 mg/L – 0.02 mg/L for surface water.

Elevated concentrations of iron above trigger values (ADWG) were recorded at all monitoring locations. Concentrations ranged from <0.05 mg/L – 12.5 mg/L for groundwater and from 0.57mg/L– 9.26 mg/L for surface water. Iron concentrations were particularly higher at location BH1.

Elevated concentrations of manganese above trigger values (ADWG) were recorded at monitoring location SW1. Concentrations ranged from <0.003 mg/L - 0.136 mg/L for groundwater and from 0.026 mg/L- 0.841 mg/L for surface water.

Elevated concentrations of nickel above trigger values (ANZECC 2000) were recorded at monitoring locations BH2, BH4, BH7, BH8, SW1, SW3 & SW4. Elevated concentrations of nickel above trigger values (ADWG) were recorded at monitoring locations BH3, BH4 and BH11. Concentrations ranged from <0.001 mg/L – 0.07 mg/L for groundwater and from <0.001 mg/L – 0.02 mg/L for surface water.

Elevated concentrations of zinc above trigger values (ANZECC 2000) were recorded at monitoring locations BH1, BH2, BH4, BH6, BH7, BH8, BH11, MW239S, SW1, SW3 and SW4. Concentrations ranged from <0.005 mg/L – 1.27 mg/L for groundwater and from <0.005 mg/L – 0.535 mg/L for surface water.

## 4.2 PHYSICAL AND CHEMICAL STRESSORS

Elevated concentrations of sulphate above trigger values (ADWG aesthetic) were recorded at monitoring location SW1. Concentrations ranged from 2.0 mg/L – 7.0 mg/L for groundwater and from 16 mg/L – 324 mg/L for surface water.

An elevated concentration of reactive phosphorus above trigger values (ANZECC 2000) default trigger values was recorded at BH1. Concentrations ranged from <0.01 – 0.03 mg/L for groundwater and <0.01-0.13 mg/L for surface water.

Elevated concentrations of total phosphorus above trigger values (ANZECC 2000) were recorded at monitoring locations BH1 and BH2. Concentrations ranged from <0.01 mg/L – 2.11 mg/L for groundwater and from 0.01 mg/L – 0.13 mg/L for surface water.

Elevated concentrations of total nitrogen above trigger values (ANZECC 2000) were recorded at monitoring locations B2, BH3, BH4, BH5, BH6, BH7 BH8, BH11, MW239S, SW1 and SW3. Concentrations ranged from <0.01 mg/L – 2.11 mg/L for groundwater and from 0.01 mg/L – 0.13 mg/L for surface water

Elevated concentrations of Total Hardness as  $CaCO_3$  above trigger values (ADWG aesthetic) were recorded at monitoring location SW1. Concentrations ranged from 5.0 mg/L – 41 mg/L for groundwater and from 26 mg/L – 299 mg/L for surface water.

Elevated concentrations of Total Dissolved Solids above trigger values (ADWG aesthetic) were recorded at monitoring location SW1. Concentrations ranged from 35 mg/L – 285 mg/L for groundwater and from 143 mg/L – 708 mg/L for surface water.

Concentrations of pH were below/outside the trigger value range at all monitoring locations. Concentrations ranged from 4.37– 6.29 for groundwater and from 4.0– 6.21 for surface water.

## 4.3 TPH, TRH AND BTEXN

No hydrocarbon exceedances above adopted criteria were recorded throughout the 12-month monitoring program. Detections were recorded at locations BH1 and BH4. Detections of hydrocarbons at BH1 can be attributed to an acrylic adhesive used for the reinstatement of the above ground section of the well. Detections of hydrocarbons at BH4 followed in close succession with rainfall recorded in the region. BH4 is located adjacent to Cabbage Tree Road and detected concentrations may be attributed to roadway runoff.

## 4.4 PFAS

One detection of PFOS above adopted aquatic criteria (LOR) protection was recorded at SW4 (0.03  $\mu$ g/L) and subsequently identified again (0.05  $\mu$ g/L) during follow-up sampling one week later. Further detections above LOR were identified at BH4 (PFDS -0.02  $\mu$ g/L) and BH6 (6:2 FTS – 0.19  $\mu$ g/L). Detections of PFAS at SW4 followed on from recent rainfall in the area which may have contributed to groundwater migration from surrounding known sources (i.e.

Williamtown RAAF Base). Kleinfelder would expect local groundwater to exceed the aquatic criteria given the scale of PFAS reported in groundwater within the Red Zone.

## 4.5 TREND ANALYSIS

A description of the trends observed throughout the 12-month monitoring period are provided in the sections below and graphical representations are located in the **Chart** section at the rear of this report.

## 4.5.1 Rainfall

Rainfall for the site was generally well below the mean average (1942-present) for the locality (BOM Williamtown RAAF 61078) over the 12-month monitoring period. Rainfall exceedances above the mean were recorded in March, June, August and September 2019 with the remainder of months experiencing significantly lower rainfall than would normally be expected. The total rainfall recorded over the 12-month monitoring program was 731.8mm which is 486.4mm less than the yearly mean total of 1218.2mm. **Chart 1** provides a graphical representation of rainfall totals for each month.

### 4.5.2 Groundwater Elevation

Groundwater throughout the sampling locations demonstrated a general decline in elevations throughout the 12-month period. Most notably the greatest decline in groundwater elevations was observed in the months following the November 2019 water monitoring event which correlate directly with a significant decrease in rainfall from the mean average and increase in temperatures. **Chart 2** provides a graphical representation of groundwater elevation identified following gauging throughout the 12-month monitoring period.

## 4.5.3 Mann Kendall Analysis

Where sufficient data is available, statistical trend analysis using the Mann-Kendall Trend Test has been undertaken for selected analytes at EPL and SWMP monitoring points to determine if obvious trends were apparent in the dataset (**Table 4.1** and **Table 4.2**). The purpose of the Mann-Kendall Test (Mann 1945, Kendall 1975, Gilbert 1987) is to statistically assess if there is a monotonic upward or downward trend of the variable of interest over time. A monotonic upward (downward) trend means that the variable consistently increases (decreases) through time, but the trend may or may not be linear.

MKA relies on three statistical metrics including:

• **The** 'S' **Statistic**: Indicates whether concentration trend vs. time is generally decreasing (negative S value) or increasing (positive S value).

- The Confidence Factor (CF): The CF value modifies the S Statistic calculation to indicate the degree of confidence in the trend result, as in 'Decreasing" vs. "Probably Decreasing" or "Increasing" vs. "Probably Increasing." Additionally, if the confidence factor is quite low, due either to considerable variability in concentrations vs. time or little change in concentrations vs. time, the CF is used to apply a preliminary "No Trend" classification, pending consideration of the COV.
- The Coefficient of Variation (COV): The COV is used to distinguish between a "No Trend" result (significant scatter in concentration trend vs. time) and a "Stable" result (limited variability in concentration vs. time) for datasets with no significant increasing or decreasing trend (e.g. low CF).

Where an analyte has recorded a non-detect following laboratory analysis half of the value of detection (LOR) has been applied.

### Table 4.1 Mann-Kendall analysis for metal

**Table 4.1** and **Table 4.2** provide trend analysis on sampling locations for a number of chemicals, primarily those identified in the EPL as requiring analysis. The trend analysis identifies if the chemical is stable, increasing or decreasing in concentration. This will be useful in future monitoring should a sample be found to be above the adopted trigger value, triggering further assessment.

The majority of the chemicals were found to be stable or no trend was identified. This is typically expected for background monitoring. A number of monitoring locations have identified decreasing trends (i.e. Barium is decreasing in BH4, BH11, SW3 and SW4 and Manganese is decreasing in BH2, BH7, SW1 and SW3). Only a few locations were found to be have an increasing trend (Copper in BH2, Chromium in BH8). Throughout the 12-month sampling period NSW was undergoing one of the worst drought periods on record. Changing concentrations of some chemicals may be due to natural fluctuations in in the water (especially following a rainfall event) and/or could be due to the drought conditions. Should this be the case then when periods of heavy rainfall occur it is likely that changes in chemical concentrations may also occur.

# 5. SITE SPECIFIC ASSESSMENT CRITERIA

## 5.1 SWMP & EMP REQUIREMENTS

As identified in **Section 1.1**Error! Reference source not found. and **1.2** the SWMP requires that surface and groundwater monitoring is to continue as identified in **Section 1.2**. However, it also states that the following monitoring parameters will be reviewed:

- Location of sampling points, e.g. more suitable / representative location identified, or sampling location has insufficient water to accurately monitor development.
- The frequency of the sampling may be reduced, or increased, depending on the fluctuations in the results.
- The parameters may be adjusted to remove superfluous analytes and/or add additional analytes.

Therefore, this section presents a review of the parameters identified and makes recommendations for the ongoing monitoring program. It is noted that any proposed changes must be approved by the Department's Secretary (or delegate) and must also be updated in the SWMP.

## 5.2 EPL REQUIREMENTS

The sites EPL minimum requirements for the monitoring of groundwater are outlined in **Table 5.1** below.

| Pollutant    | Unit of measure                        | Frequency | Sampling Method | Sample location                           |
|--------------|--|-----------|-----------------|---|
| Arsenic      | mg/L                                   | Monthly   | Grab Sample     | BH2, BH4, BH6, BH7, BH9,<br>BH11 & MW239S |

Table 5.1EPA Site water monitoring requirements (EPL21264)

# 5.3 ANALYTICAL PARAMETERS

This section provides details on the recommended analytical suite for ongoing monitoring (note this is in addition to the requirements of the EPL).

### 5.3.1 Metals

Beryllium, Cadmium, Mercury, Selenium, Vanadium were all identified to be below the laboratory LOR throughout the 12-month sampling period. The operations across the Site are not considered likely to introduce sources of these metals and therefore it is not considered necessary to continue to monitor for these metals. Analysis for lead identified only four samples out of 124 to be above the LOR and these were reported at the LOR. Analysis for Cadmium identified only 3 samples at SW1 to be at or marginally above the LOR. It is recommended that Lead and Cadmium also be removed from the monitoring programme.

Concentrations of Boron were identified to be present above the LOR in 7 samples. However, the exception is SW1 where all samples taken had concentrations above LOR. Cobalt was found to be above LOR in one sample with the exception of surface water and in BH7. There are no trigger values presented in the ANZECC 2000 guidelines. It is considered unlikely that the quarrying operations would introduce Boron and Cobalt into the environment at significant concentrations and therefore it is recommended that Boron and Cobalt not be analysed in groundwater. However, due to the presence of Boron in SW1 and Cobalt in the surface water, both Boron and Cobalt should continue to be monitored in surface water. Should future surface water monitoring identify an increase in Boron or Cobalt concentrations, then consideration should be given to adding these to the groundwater analytical suite.

It is recommended that 8 Metals continue to be analysed in groundwater and surface water:

- Arsenic (this is required by the EPL);
- Barium (all samples were above LOR, there is no ANZECC criteria for Barium);
- Chromium (samples were found to be above LOR and some samples were found to be above the ANZECC trigger criteria);
- Copper (samples were found to be above LOR and some samples were found to be above the ANZECC trigger criteria);
- Iron (this is required by the EPL);
- Manganese (this is required by the EPL);
- Nickel (samples were found to be above LOR and some samples were found to be above the ANZECC trigger criteria); and
- Zinc (samples were found to be above LOR and some samples were found to be above the ANZECC trigger criteria).

An additional two metals (Boron and Cobalt) should also be analysed in surface water.

### 5.3.2 Nutrients

Concentrations of Total Phosphorous and Total Nitrogen were found to be elevated above ANZECC 2000 Trigger Values for a low land river in south-east Australia in a number of sampling locations on multiple occasions.

Concentrations of Ammonia were also identified to be present above LOR, however, concentrations were all recorded below the ANZECC 2000 Trigger Values and aesthetic ADWG values.

It is therefore considered appropriate to maintain sampling to identify potential significant changes in concentrations that would impact the local environment.

### 5.3.3 Hydrocarbons

With the exception of 4 samples, all concentrations were found to be below the LOR. However, the quarry operations plan to store diesel fuel on site for the operational plant. The site will also have a maintenance workshop where oils, greases, lubricants and cleaning agents (degreasers) will be stored and used on site. It is therefore necessary to continue to monitor for hydrocarbons.

It is recommended that TRH continues to be monitored. Should the TRH identify concentrations of  $C_6$  to  $C_{10}$  then this should trigger further analysis of BTEXN. Likewise, should concentrations of  $C_{16}$  to  $C_{40}$  be identified then this should trigger the analysis of PAH.

### 5.3.4 PFAS

The majority of results were identified to be below the LOR. However, due to the sensitive nature of PFAS and the location of the site being on the edge of the Williamtown Red Zone, PFAS monitoring should continue.

## 5.4 LOCATIONS

BH2, BH4, BH6, BH7, BH9, BH11 and MW239S are required to be monitored on a monthly basis as part of the EPL requirements. It is noted that MW9 has been dry consistently through the background monitoring period.

In addition to the above it is recommended that BH8 also be monitored.

## 5.5 SCHEDULE

Monthly monitoring is required by the EPL. It is not recommended that additional monitoring be undertaken above this every month.

It is recommended that quarterly monitoring be undertaken to include:

- 8 metals (as identified above);
- TRH;
- PFAS;
- Nutrients (Total Phosphorus, Total Nitrogen and Ammonia as N); and
- and the inclusion of sampling BH8.

As part of the quarterly monitoring, all available wells should be gauged for groundwater depths and observed for monitoring well condition.

In order to review and confirm the continued relevance of the outcome of this summary document and proposed analytical program, an annual monitoring event should be undertaken including all analytes and locations sampled as part of the background monitoring.

Additional analysis may be required should there be a recorded spill event or other potential pollution incident.

## 5.6 SUMMARY OF PROPOSED SAMPLING

**Table 5.2** provides a summary of the proposed ongoing operational monitoring schedule for the site. **Table 5.3** provides a summary of the proposed testing schedule for the different monitoring events.

| Table 5.2 | Proposed operational    | monitoring schedule |
|-----------|-------------------------|---------------------|
|           | i i oposcu opci alional | monitoring seneaute |

| Location                                    | Monthly      | Quarterly | Annually     |
|---|--------------|-----------|--------------|
| BH2, BH4, BH6, BH7, BH9, BH11 and<br>MW239S | $\checkmark$ | ~         | $\checkmark$ |
| BH8<br>SW1, SW2, SW3, SW4                   |              | ~         | $\checkmark$ |
| BH1, BH5, BH12                              |              |           | $\checkmark$ |

## 5.7 SITE SPECIFIC TRIGGER VALUES

As discussed in **Section 1.3** one of the objectives of this report is to establish Site specific trigger values to be used for long-term monitoring during the operation of the sand quarry. An exceedance of a trigger value does not necessarily indicate that there is an unacceptable risk on site, but rather a trigger for further investigation or evaluation of management options (CRC-CARE Technical Report 10: 2011). **Section 5.8** provides details on the proposed action response should a trigger value be exceeded.

The baseline groundwater and surface water assessment criteria adopted for future quarry extraction works for locations to be monitored under the Sites EPL, and defined in the SWMP, are summarised below. Nationally accepted water quality guidelines; ANZECC (2000) *Australian and New Zealand Water Quality Guidelines for Fresh and Marine Waters, 95% species Protection for freshwater,* HEPA NEMP (2018) *PFAS National Environmental Management Plan* and ADWG (2011) *Australian Drinking Water Guidelines 6,* have been considered in developing site specific trigger values.

**Table 5.4** and **Table 5.5** presents the proposed trigger values for groundwater and surface water respectively along with a justification for selecting that value. The trigger values are to be applied to the sample locations monitored monthly and quarterly. Locations monitored as part of the annual monitoring should be compared against currently available data for that location only as they have not been considered when developing the trigger values.

### Table 5.4Site specific trigger values for Groundwater

| Analyte                            | Units       | Adopted Site<br>specific<br>trigger value | Location  | Justification  |  |  |  |  |  |
|------------------------------------|-------------|---|-----------|--|--|--|--|--|--|
|                                    | Inorganics  |   |           |  |  |  |  |  |  |
| рН                                 | pH<br>units | 4 - 7                                     | Site wide | The lowest pH value recorded was 4.37 (noting 4.0 in surface water). It is feasible that pH values could continue to be low. The highest pH value recorded was 6.21 indicating a generally acidic environment. It is therefore unlikely the pH would exceed 7.   |  |  |  |  |  |
| Total Phosphorus                   | mg/L        | 2   | Site wide | The majority of baseline results were found to be elevated above the ANZECC 2000 trigger values for a Lowland river in South-east Australia. It is therefore not considered appropriate to use this criterion. The majority of baseline sample results were less than 2mg/L, however it is noted that the highest value recorded was 2.76mg/L at BH3 (noting one sample event and the well is no longer operational) and 2.11mg/L in BH11. The third highest concentration of 1.97mg/L was located at BH8. The sample locations identified represent a large cross section of the Site therefore represent the likely range that could be expected at the Site.  |  |  |  |  |  |
| Ammonia as N                       | mg/L        | 0.5                                       | Site wide | The detected range of <0.01-0.34mg/L was not found to be elevated above the ANZECC 2000 and ADWG. Based on the results obtained it is considered that adopting the 0.5mg/L ADWG provides a conservative value for a trigger response. It is noted that the ANZECC criteria is 0.9mg/L.   |  |  |  |  |  |
| Total Nitrogen as N                | mg/L        | 3   | Site wide | Results from the majority of locations were generally found to be elevated above the ANZECC 2000 trigger values, with the exception of BH1 where concentrations were recorded to be marginally lower than the initial criteria. The highest concentrations were recorded in BH11 (considered to be up hydraulic gradient of the Site) and BH2 located centrally on Site. Concentrations as high as 2.2mg/L (in BH7) were identified at locations down/ cross hydraulic gradient of the Site. It is evident that concentrations of Nitrogen can be found naturally across the Site and can be varied over time. Concentrations of Total Nitrogen are not expected to be elevated above the highest recorded value of 5.9mg/L. However, to maintain a level of conservatism a trigger value of 3mg/L (half the highest concentration) has been adopted understanding that four previous samples exceeded this value. Elevated concentrations above the adopted trigger value is a requirement to look at the concentration with more detail to determine if it is in line with previous sampling results or considered to be an outlier potentially presenting a significant increase. |  |  |  |  |  |
| Electrical Conductivity<br>@ 25°C* | µc/cm       | 125-2200                                  | Site wide | Concentrations across the Site were identified to vary considerably. However, no concentration was found to be elevated above 2200 µc/cm.<br>Trigger criteria has been taken from ANZECC 2000 for a lowland river is south-eastern Australia and is considered appropriate.  |  |  |  |  |  |

| Analyte   | Units | Adopted Site<br>specific<br>trigger value | Location   | Justification   |
|-----------|-------|---|--|---|
| Turbidity | NTU   | 6-50                                      | Site wide  | Criteria taken from ANZECC 2000 for a lowland river is south-eastern Australia.   |
|           |       |   |  | Dissolved Metals  |
| Arsenic   | mg/L  | 0.003                                     | Site wide  | Arsenic was not detected within the majority of groundwater locations with the exception of BH8 recording a maximum concentration of 0.003 mg/L. The adopted trigger value has been taken as the maximum value obtained throughout the baseline monitoring period.  |
| Barium    | mg/L  | 0.035                                     | Site wide         All results for Barium were found to be above the LOR. The highest concentration record           0.034mg/L in BH6 (considered to be up/ cross hydraulic gradient of the Site). The adopt value has been taken to be one significant figure above the highest concentration. |   |
| Chromium  | mg/L  | 0.004                                     | Site wide  | All locations recoded concentrations of chromium at or marginally above LOR. Exceedances above initial baseline criteria (ANZECC 2000) were recorded at most locations with the exception of BH4 & BH6. The adopted trigger value has been taken as the maximum value obtained throughout the baseline monitoring period.   |
|           |       | 0.013                                     | Site wide<br>(except BH4)  | Detections of copper concentrations above LOR were recorded at all locations. The adopted trigger value has been taken as the maximum value obtained throughout the baseline monitoring period.   |
| Copper    | mg/L  | 0.051                                     | BH4  | Concentration range for copper at location BH4 was generally greater than other locations. It is feasible that stormwater runoff from the adjacent Cabbage Tree Road may impact this borehole. Therefore, a higher specific trigger value has been adopted which is the highest concentration identified during the baseline monitoring.  |
| Iron      | mg/L  | 4.1                                       | Northern Half<br>(BH6, BH7,<br>BH8, BH11<br>and MW239S),   | The Site can be divided into a northern section and southern section with an access road between<br>the two sections (between BH2 and SW2). The north and south areas are divided by surface water<br>(where SW2 and SW3 are located). Upon review of the groundwater data from the baseline<br>monitoring it appears that there are greater concentrations of iron in the northern area than the<br>southern area.<br>Two separate criteria have been developed based on this. The highest concentration identified<br>during the baseline monitoring for this area has been adopted as the Trigger Value. |
|           |       | 1   | Southern half<br>(BH2, BH4,<br>BH9)  | The highest concentration identified during the baseline monitoring for this area has been adopted as the Trigger Value.  |

| Analyte   | Units | Adopted Site<br>specific<br>trigger value | Location                         | Justification   |  |
|---|-------|---|----------------------------------|---|--|
|   |       |   |                                  | BH1, BH5, BH12 are only proposed to be sampled during the annual monitoring round. When assessing these wells, concentrations will be assessed against previous criteria for those locations.   |  |
| Manganese   | mg/L  | 0.136                                     | Site wide                        | A similar range of results were identified across all locations. BH4 recorded the highest value of Manganese (0.136mg/L) across the Site. The highest concentration identified during the baseline monitoring has been adopted as the Trigger Value. It is noted that the ANZECC 2000 criteria is 1.9mg/L.  |  |
|   |       | 0.037                                     | BH11                             | BH11 is located to the north of the Site and is considered to be in an up hydraulic gradient location. The highest concentration identified in BH11 was 0.037mg/L. This has been adopted as the trigger value for this location.  |  |
| Nickel  | mg/L  | 0.022                                     | Site wide<br>(excluding<br>BH11) | With the exception of BH6 and MW239S, at least one concentration from each monitoring location throughout the baseline monitoring was found to be elevated above than the ANZECC 2000 trigger values. Generally, concentrations of Nickel are similar across the Site (with the exception of BH11). Therefore, the highest recorded value from the baseline monitoring round has been adopted as the trigger value.                                 |  |
| Zinc  | mg/L  | 0.085                                     | Site wide                        | At least one concentration from each monitoring location throughout the baseline monitoring was found to be elevated above than the ANZECC 2000 trigger values. Generally, concentrations of Zinc are similar across the Site. Therefore, the highest recorded value from the baseline monitoring round has been adopted as the trigger value.<br>Noting that BH1 is not proposed to be sampled until the annual monitoring round where the results |  |
|   | [     |   |                                  | should be assessed against previous results from that location only. TRH  |  |
| TRH C <sub>6</sub> – C <sub>10</sub>                  | µg/L  | 20  | Site wide                        | Concentrations of TRH were identified to be below the LOR for the majority of the baseline  |  |
| C <sub>6</sub> - C <sub>10</sub> minus BTEX<br>(F1)   | µg/L  | 20  | Site wide                        | monitoring. The exceptions were following well maintenance work or were observed in BH4 following a high rainfall event. It is feasible that stormwater runoff from the adjacent Cabbage True   |  |
| TRH C <sub>10</sub> – C <sub>16</sub>                 | µg/L  | 100                                       | Site wide                        | <ul> <li>Road may locally impact BH4.</li> <li>Based on the understanding of the above, generally TRH is not identified within the groundwater</li> </ul>   |  |
| TRH C <sub>10</sub> - C <sub>16</sub> minus N<br>(F2) | µg/L  | 100                                       | Site wide                        | across the Site. The Laboratory LOR has therefore been adopted as a trigger value.  |  |
| TRH C <sub>16</sub> – C <sub>34</sub>                 | µg/L  | 100                                       | Site wide                        |   |  |

| Analyte                               | Units | Adopted Site<br>specific<br>trigger value | Location  | Justification  |  |  |
|---------------------------------------|-------|---|-----------|--|--|--|
| TRH C <sub>34</sub> - C <sub>40</sub> | µg/L  | 100                                       | Site wide |  |  |  |
| PFAS                                  |       |   |           |  |  |  |
| PFOS+ PFHxS                           | µg/L  | 0.07                                      | Site wide | Site criteria has been provided in the SWMP. In 2016, Food Standards Australia New Zealand   |  |  |
| PFOA                                  | µg/L  | 0.56                                      | Site wide | (FSANZ) were commissioned to develop health-based guidance values for a selection of PFAS.<br>FSANZ (2017) published levels for use in Site investigations which were updated and incorporated<br>into the HEPA NEMP (2018), which was revised in 2019. The HEPA NEMP (2019) is the<br>recognised national guidance for the investigation and management of PFAS in Australia and<br>forms the key guidelines for this SWMP. This has therefore been adopted in this report. |  |  |
| PFOS                                  | µg/L  | 0.01                                      | Site wide | Standard LOR has been adopted as the Site wide criteria as it is known that PFAS are widely present in the local area owing to the Red Zone. Ambient concentrations have been detected above this in groundwater emanating from Williamtown RAAF Base.   |  |  |

1- National Health and Australian Drinking Water Guidelines 6 (ADWG) (2011) ANZECC (2000) 95% level of species protection in freshwater -

| Analyte          | Units       | Adopted Site<br>specific<br>trigger value | Location  | Justification  |  |  |
|------------------|-------------|---|-----------|--|--|--|
| Inorganics       |             |   |           |  |  |  |
| рН               | pH<br>units | 4 - 7                                     | Site wide | The lowest pH value recorded was 4.01 in surface water). It is feasible that pH values could continue to be low. The highest pH value recorded was 6.21 indicating a generally acidic environment. It is therefore unlikely the pH would exceed 7.   |  |  |
| Total Phosphorus | mg/L        | 0.13                                      | Site wide | The two out of the 10 surface water baseline results were found to be above the ANZECC 2000 trigger values for a Lowland river in South-east Australia. It is therefore not considered appropriate to use this value. The highest recorded value in the surface water was 0.13mg/L in SW1. This value has been adopted as the trigger value for surface water. |  |  |
| Ammonia as N     | mg/L        | 0.25                                      | Site wide | The detected range of <0.01-0.16mg/L was not found to be elevated above the ANZECC 2000 and ADWG. Based on the results obtained it is considered that adopting half the 0.5mg/L ADWG value provides a conservative approach for a trigger level. It is noted that the ANZECC criteria is 0.9mg/L.  |  |  |

| Analyte                            | Units | Adopted Site<br>specific<br>trigger value | Location  | Justification   |  |
|------------------------------------|-------|---|-----------|---|--|
| Total Nitrogen as N                | mg/L  | 1.8                                       | Site wide | Results from the majority of locations were found to be elevated above the ANZECC 2000 trigger criteria. The highest concentrations were recorded in SW1. It is evident that concentrations of Nitrogen can be found naturally across the Site and vary over time. Concentrations of Total Nitrogen are not expected to be elevated above the highest recorded value of 1.8mg/L. Therefore, this has been adopted as the trigger value. |  |
| Electrical Conductivity<br>@ 25°C* | µc/cm | 125-2200                                  | Site wide | Concentrations across the Site were identified to vary considerably. However, no concentration was found to be elevated above 2200 µc/cm.<br>Trigger criteria has been taken from ANZECC 2000 for a lowland river is south-eastern Australia and is considered appropriate for this Site.   |  |
| Turbidity                          | NTU   | 6-50                                      | Site wide | Criteria taken from ANZECC 2000 for a lowland river is south-eastern Australia.   |  |
|                                    |       |   |           | Dissolved Metals  |  |
| Arsenic                            | mg/L  | 0.001                                     | Site wide | Arsenic was not detected within the majority of groundwater locations with the exception of SW3 recording a maximum concentration of 0.006 mg/L. As the majority of results were recorded below the LOR, the adopted trigger value has been taken as the laboratory LOR.  |  |
| Barium                             | mg/L  | 0.08                                      | Site wide | All results for Barium were found to be above the LOR. The highest concentration recorded was 0.08mg/L in SW3. The adopted trigger value has been taken to be the highest concentration recorded.   |  |
| Boron                              | mg/L  | 0.14                                      | SW1       | All results at SW1 for Boron were found to be above the LOR compared to all other locations that had concentrations below LOR. Therefore, a location specific trigger value has been adopted for SW1.   |  |
|                                    |       | 0.05                                      | SW3 & SW4 | All results were found to be below the LOR. The adopted trigger value has been taken as LOR.  |  |
| Chromium                           | mg/L  | 0.002                                     | Site wide | The majority of results were found to be below the LOR with one result higher than the ANZECC 2000 trigger value recorded in SW3. The adopted trigger value has been taken as the maximum value obtained throughout the baseline monitoring period.   |  |
| Cobalt                             | mg/L  | 0.017                                     | Site wide | Detections of Cobalt concentrations above LOR were detected at all surface water locations. The highest concentration was 0.017mg/L in SW1. The adopted trigger value has been taken to be the highest concentration recorded.  |  |
| Copper                             | mg/L  | 0.013                                     | Site wide | Detections of Copper concentrations above LOR were recorded at all locations. The adopted trigger value has been taken as the same value as the groundwater trigger value. The maximum value obtained in surface water throughout the baseline monitoring period was 0.012mg/L.   |  |

| Analyte   | Units | Adopted Site<br>specific<br>trigger value | Location   | Justification   |  |
|---|-------|---|--|---|--|
| Iron  | mg/L  | 9.26                                      | Site wide  | The concentrations of Iron identified in the surface water monitoring results were varied and the Mann-Kendal analysis identified a decreasing trend in SW1 and SW3 and no trend in SW4. The highest concentration identified during the baseline monitoring for this area has been adopted as the Trigger Value. Based on the trend analysis it is not expected this value would be exceeded as the Trigger Value. |  |
|   | mg/L  | 0.048                                     | SW1 & SW3  | Concentrations of manganese in SW1 and SW3 were found to be similar. The highest concentration identified has been adopted as the trigger value for these locations.  |  |
| Manganese   |       | 0.841                                     | SW4  | Concentrations of manganese in SW4 were found to be elevated above those in SW1 and SW3. It is feasible that stormwater runoff from the adjacent Cabbage Tree Road may impact this location. Therefore, the highest concentration found in SW4 has been taken as the trigger value.   |  |
| Nickel  | mg/L  | 0.022                                     | Site wide Concentrations of nickel in each of the surface water locations was found to be similar. The highest concentration identified in SW1 was 0.02mg/L. This is similar to the trigger value adopte for groundwater; therefore, the same value has been adopted as the trigger value. |   |  |
|   |       | 0.085                                     | SW1 & SW3  | Concentrations of Zinc in SW1 and SW3 were found to be similar. The highest concentration identified has been adopted as the trigger value for these locations.   |  |
| Zinc  | mg/L  | 0.535                                     | SW4  | Concentrations of Zinc in SW4 were found to be elevated above those in SW1 and SW3. It is feasible that stormwater runoff from the adjacent Cabbage Tree Road may impact this location. Therefore, the highest concentration found in SW4 has been taken as the trigger value.  |  |
|   |       |   |  | TRH   |  |
| TRH C <sub>6</sub> – C <sub>10</sub>                  | µg/L  | 20  | Site wide  | All concentrations of TRH were identified to be below the LOR. The Laboratory LOR has therefore   |  |
| C <sub>6</sub> - C <sub>10</sub> minus BTEX<br>(F1)   | µg/L  | 20  | Site wide  | been adopted as the trigger value.  |  |
| TRH C <sub>10</sub> – C <sub>16</sub>                 | µg/L  | 100                                       | Site wide  |   |  |
| TRH C <sub>10</sub> - C <sub>16</sub> minus N<br>(F2) | µg/L  | 100                                       | Site wide  |   |  |
| TRH C <sub>16</sub> – C <sub>34</sub>                 | µg/L  | 100                                       | Site wide  |   |  |
| TRH C <sub>34</sub> - C <sub>40</sub>                 | µg/L  | 100                                       | Site wide  |   |  |

| Analyte     | Units | Adopted Site<br>specific<br>trigger value | Location  | Justification   |
|-------------|-------|---|-----------|---|
|             |       |   |           | PFAS  |
| PFOS+ PFHxS | µg/L  | 0.07                                      | Site wide | Site criteria has been provided in the SWMP. In 2016, Food Standards Australia New Zealand  |
| PFOA        | µg/L  | 0.56                                      | Site wide | (FSANZ) were commissioned to develop health-based guidance values for a selection of PFAS.<br>FSANZ (2017) published levels for use in Site investigations which were updated and incorporated<br>into the HEPA NEMP (2018). The HEPA NEMP (2018), revised in 2019, is the recognised national<br>guidance for the investigation and management of PFAS in Australia and form the key guidelines<br>for this SWMP.<br>This has therefore been adopted in this report. |
|             |       |   |           | Standard LOR has been adopted as the Site wide criteria as it is known that PFAS are widely   |
| PFOS        | µg/L  | 0.01                                      | Site wide | present in the local area owing to the Red Zone. Ambient concentrations have been detected above this in groundwater emanating from Williamtown RAAF Base.  |

## 5.8 TRIGGER RESPONSE ACTIONS

## 5.8.1 Metals & Nutrients

The following provides details on the proposed response action required should an analyte concentration be found above the adopted trigger value:

- Review value against previous data including Mann-Kendal trends presented in **Table 4.1** to determine if the concentrations is in line with previous monitoring data, or if considered significantly different then:
  - Question result with the laboratory;
  - Discuss what operations have been undertaken that may cause the elevated concentration; and
  - Review rainfall data and groundwater elevations to establish if concentration is due to seasonal adjustments.
- Re-sample location and elevated metal in the following two monthly monitoring rounds to gauge if the exceedance was an exception of change in trend or characteristic of background changes.

Where the outcome of the above assessment indicates a potential contamination issue then a water trigger investigation should be undertaken in accordance with the SWMP (see **Section 5.8.4**).

### 5.8.2 Hydrocarbons

The following provides details on the proposed response action required should an analyte concentration be found above the adopted trigger value:

- Question result with the laboratory to determine if there were any laboratory errors;
- Discuss what operations have been undertaken that may cause the elevated concentration;
- Review rainfall data and groundwater elevations to establish if concentration is due to seasonal adjustments; and
- Re-sample location in the following two monthly monitoring rounds to gauge if the exceedance was an exception of change in trend, or characteristic of background changes, and include the following additional analysis:
  - $\circ$  Where TRH C<sub>6</sub> to C<sub>10</sub> has been detected then BTEXN will also be analysed; and/or
  - $\circ$  Where TRH C<sub>16</sub> to C<sub>40</sub> has been detected then PAH will also be analysed.

Where the outcome of the above indicates a potential issue then a water trigger investigation should be undertaken in accordance with the SWMP (see **Section 5.8.4**).

Where a spill or potential pollution incident event has occurred, or the above conversation with the quarry operations indicates a potential contamination issue, then sampling (or re-sampling) at the closest (down hydraulic gradient) location should be undertaken within 48 hours. An incident investigation in accordance with the SWMP must be undertaken.

## 5.8.3 **PFAS**

Where PFAS is identified above the adopted criteria (or maximum background value detected previously at a specific monitoring location) an additional water sample will be collected within 48 hours and submitted for analysis. In the event the trigger value is exceeded by more than 10% in both the primary sample and the follow-up sample, a water trigger Investigation will be completed to determine if the change is related to:

- The quarry operations;
- External influence; and/or
- Natural variation.

## 5.8.4 Water Trigger Investigation

Upon triggering the need for a water trigger investigation Hunter Water Corporation (HWC), NSW Environmental Protection Agency (EPA) and Department of Planning Industry and Environment (DPIE) must be notified within 24hours. The SWMP stipulates that the water trigger investigation will evaluate the following:

- A review of the site conceptual site model to understand the risk potential of the exceedance;
- Identify the potential for other sources to be present that may require confirmatory sampling (and include intrusive investigation if considered appropriate);
- Recent climate and rainfall data;
- Other activities within the catchment (both on and off the Site) in the preceding period;
- Operational activities of the quarry in the preceding period; and
- Historical potential for those quarry activities to cause exceedance.

The water trigger investigation report will be submitted as an incident notification to HWC, EPA and DPIE. The report will also be summarised in the Annual Environmental Review (AER).

# 6. QUALITY ASSURANCE AND QUALITY CONTROL

## 6.1 DATA VALIDATION

The QA/QC program implemented for this monitoring program followed the requirements of the SWMP.

Data Quality Indicators (DQIs) were developed prior to commencing background monitoring and have been summarised in **Table 6.1.** DQIs established acceptable limits for field and laboratory data collected from the monitoring program.

| QA/QC Objective   | Data quality indicator (DQI)  |
|---|---|
| Successful<br>completion of<br>project  | To conduct a baseline water quality sampling program in accordance with NEPM 2013 and AS4482.1 – 1999 in order to achieve the objective set out in <b>Section 1</b> .   |
| Suitable<br>environmental<br>consultant   | The environmental consultant was to maintain QA Systems certified to AS/NZS ISO 9001:2015.  |
| Suitable field<br>personnel   | All Kleinfelder field personnel conducting sampling were to be trained in the requirements detailed in this SWMP. All Kleinfelder field personnel have relevant tertiary qualifications and have demonstrated competence in Kleinfelder procedures for sampling (consistent with NEPM 2013 and AS4482.1 - 1999).                      |
| Adequate sample collection density  | The sampling strategy was developed based on historical information available for the site and the objective of the investigation.  |
| Standardised<br>sample<br>nomenclature  | All samples were labelled with a unique identifier that can be related to sample location.<br>Surface water and Groundwater samples were labelled as per monitoring well ID. The<br>following naming convention was utilised:<br>Bore Hole (BH) – Number (1, 2, 3):<br>E.g. MW1<br>Surface water (SW) – Number (1, 2, 3):<br>E.g. SW1 |
| Decontamination of field equipment  | When sampling equipment was used, nitrile gloves were worn and changed between locations. Non-dedicated sampling equipment was decontaminated between sample locations using an appropriate surface-active cleaning agent (e.g. Liquinox for use with PFAS) as consistent with NEPM 2013 and HEPA NEMP (2019).                        |
| Calibration of field<br>instruments   | All field instruments were calibrated prior to use, and the calibration certificates have been provided in <b>Appendix A</b> .  |
| Transportation  | A Chain of Custody (COC) document was used to ensure the integrity of the samples from collection to receipt by the analytical laboratory within appropriate holding times.   |
| National<br>Association of<br>Testing Authorities<br>(NATA) accredited<br>laboratory analysis | <ul> <li>All samples were forwarded to a laboratory holding NATA accreditation for the required analyses.</li> <li>The following Laboratories were utilised: <ul> <li>ALS – Primary Laboratory for chemical analysis; and</li> <li>Eurofins – Secondary Laboratory for chemical analysis.</li> </ul> </li> </ul>                      |

 Table 6.1
 QA/QC data quality indicators

| QA/QC Objective                                | Data quality indicator (DQI)   |
|--|--|
| Field QA/QC                                    | Duplicate samples (intra-laboratory) were collected at a rate of one in every twenty (1:20) primary water samples and submitted to the primary laboratory for analysis. Standard NEPM 2013 duplicate and triplicate requirements were deemed reasonable for the sampling of PFAS for the purpose of baseline water monitoring. Triplicate samples (inter-laboratory) were also collected at a rate of one in every twenty (1:20) primary water samples and submitted to the secondary laboratory for analysis. Field duplicate and triplicate samples are used to assess field and analytical precision and the precision measurement is determined using the relative percent difference (RPD) between the primary sample (X1) and duplicate sample (X2) results, as shown in the following equation: |
|  | Relative percent difference (RPD) = $(X1 - X2) \times 100$   |
|  | (X1 + X2)/2<br>Generally, it is recommended that RPD is <30% (NEPM 2013).  |
|  | Default RPD levels in the field may be non-compliant for the following reasons:  |
|  | <ul> <li>The differing laboratory equipment, procedures and limits of reporting (between the primary and secondary laboratories);</li> <li>Due to sample matrix interference; and/or</li> </ul>  |
|  | • Due to the reported concentrations being close to the limit of reporting where laboratory precision and accuracy are inherently low.   |
|  | A rinsate blank sample was collected for each piece of non-dedicated sampling equipment per day onsite and submitted to the primary laboratory for analysis.   |
|  | A transport blank sample was collected for each batch of samples sent to the laboratory (~one per day in the field) and submitted to the primary laboratory for analysis for each day samples are taken.   |
|  | QA/QC non-compliance was documented and discussed in the monthly summary letter (see <b>Appendix B</b> ). Where exceedances were identified (i.e. duplicates and triplicates be above the RPD or rinsate blanks, field blanks or transport blanks be above the LOR) then consideration was given to the sample(s) being re-analysed, the higher concentration level to be conservatively adopted and/or reviewing field practices for continued prevention of potential cross contamination.   |
| Laboratory Quality                             | Laboratory QA/QC acceptance limits are as follows:   |
| Control –<br>Duplicates, spikes,<br>blanks and | Surrogates: 70% to 130% recovery;<br>Matrix Spikes: 70% to 130% recovery for organics or 80% to 120% recovery for<br>inorganics;   |
| surrogates –<br>Acceptable Limits              | Control Samples: 70% to 130% recovery for soil or 80% to 120% recovery for waters;<br>Duplicate Samples: <4 Practical Quantitation Limits (PQL) - +/- 2PQL, 4-10PQL – 025<br>or 50%RPD, >10PQL – 0-10 or 30%RPD; and   |
|  | Method Blanks: zero to <pql.< td=""></pql.<>   |

## 6.2 QA/QC RESULTS

## 6.2.1 Field Method Validation

To ensure the completeness, comparability, representativeness, precision and accuracy of QA/QC items, **Table 6.2** details how the QA/QC compliance has been met.

| Table 6.2 | Field QA/QC |
|-----------|-------------|
|-----------|-------------|

| QA/QC Objective                     | Data Quality Indicator (DQI)   |
|-------------------------------------|--|
| Suitable field<br>personnel         | The site work was undertaken by Dan Kousbroek who has 4 years' experience in contaminated land investigations. Dan was informed of the requirements of the agreed scope of works. Dan has relevant tertiary qualifications and has demonstrated competence with Kleinfelder's sampling procedures (consistent with NEPM 2013 requirements and AS4482.1 2005).                    |
| Adequate sample collection density  | Water sampling was undertaken based on information provided in the SWMP.<br>A targeted sampling program was undertaken requiring sampling at 10 groundwater<br>locations and 4 surface water locations and then analysed. It is noted that a number of<br>the surface water locations were found to be dry throughout the 12 months due to an<br>extended drought period in NSW. |
| Field equipment                     | YSI 556 Water Quality Meter and Solinst oil/water interface meter were used during field works.  |
| Calibration of field<br>instruments | Calibration certificates for each piece of equipment used in the field are attached in <b>Appendix A</b>   |
| Sample<br>preservation              | Samples were collected in laboratory supplied containers and immediately stored in an insulated esky chilled with ice.   |
| Sample handling                     | Samples were delivered straight to ALS Newcastle following each sampling event.<br>Chains of custody are included in Appendix A of the monthly reports, which have been<br>provided as <b>Appendix B</b> of this document.   |

## 6.2.2 Laboratory QA/QC

The results for internal laboratory QA/QC procedures are provided within the laboratory analysis reports (Appendix A of the monthly reports, which have been provided as **Appendix B** of this document). **Table 6.3** summarises conformance to specific QA/QC procedures, also see **Tables E, F** and **G** at the rear of this report for a summary of the data.

| Quality assurance   | Conformed | Comment  |
|---|-----------|--|
| Collection of rinsate water<br>from decontaminated field      | Yes       | Rinsate was sourced from a NATA accredited laboratory and supplied with the sample containers.   |
| equipment   |           | A rinsate sample was taken from the sampling equipment<br>during each sampling event. A total of 12 rinsate samples were<br>taken. All samples were non detect.  |
|   |           | See Tables E, F and G at the back of this report.  |
| Collection of transport<br>blanks through the sampling<br>day | Majority  | 12 transport blank samples were collected (two samples in March (due to a return confirmatory sampling event), no transport taken in August 19)  |
|   |           | 2 <sup>nd</sup> transport blank taken in March (15/03/19) was found to contain barium (2ug/l). As no other transport blanks were found to have concentrations above LOR and the following months samples resulted in non detect the data is considered reliable. |
|   |           | See Tables E, F and G at the back of this report.  |
| Holding times met   | Yes       | Holding times were met for all analytes and samples.   |
|   |           | Every effort was made by Kleinfelder to deliver samples to the laboratory as soon as possible after sampling.  |

Table 6.3Laboratory QA/QC

| Quality assurance   | Conformed | Comment  |  |
|---|-----------|--|--|
| LOR less than assessment criteria   | Yes       | Majority of LOR were below the adopted screening criteria.<br>Adopted criteria for PFOS (HEPA NEMP 2018) is below LOR. I<br>is noted that PFAS are likely to be in the region given the<br>reported scale of PFAS in groundwater within the Red Zone,<br>therefore the standard LOR has been adopted.  |  |
| All analyses National<br>Association of Testing<br>Authorities (NATA)<br>accredited                           | Yes       | All samples were delivered to a NATA accredited laboratory for<br>the required analysis, within specified holding times. The<br>primary laboratory used was ALS (delivered to the Newcastle<br>laboratory). Triplicate samples were forwarded by ALS to the<br>secondary laboratory, Eurofins mgt (Newcastle).   |  |
| Field intra-laboratory<br>duplicate samples collected<br>and analysed to represent<br>5% of sample population | Majority  | One intra-laboratory duplicate sample and one inter-laboratory triplicate water sample were collected. This is considered to exceed the requirement of 5% of the total number of primary analyses undertaken (minimum 1 in 20 duplicate and 1 in 20 triplicate samples). Due to a laboratory error in transferring samples, one intra-laboratory triplicate (March 2019) was only sampled for Metals and PFAS with TRH and BTEX being missed from the COC to the tertiary laboratory. With the exception of some minor elevations of TRH and BTEX which were attributed to maintenance work on the well, there were no recorded concentrations above LOR. Therefore, this is not considered to impair the reliability of data in meeting the objectives of this monitoring programme. See <b>Table 6.5</b> for details.  |  |
| Did duplicate sample meet<br>RPD requirements   | Majority  | <ul> <li>The majority of samples met the RPD requirements of being within 30% (See Tables E, F and G at the back of this report). The following did not meet these requirements:</li> <li>Arsenic – 67% BH8 (Feb 2019)</li> <li>Cobalt – 40% BH7 (March 2019)</li> <li>Copper – 190% SW4 (September 2019)</li> <li>Lead – 67% SW4 (September 2019)</li> <li>Nickel – 140% SW4 (September 2019), 67% BH6 (January 2020)</li> <li>Zinc – 100% BH8 (February 2019), 151% SW4 (September 2019)</li> <li>In general, for these exceedances at least one sample was found to be below or close to the Laboratory LOR, which leads to exaggerated RPD calculations. In order to take a conservative approach, the highest recorded concentration has been selected for results screening. These RPD exceedances are therefore not considered to have a negative impact on the outcome of the assessment.</li> </ul> |  |
| Did triplicate sample meet<br>RPD requirements  | Majority  | <ul> <li>The majority of samples met the RPD requirements of being within 30% (See Tables E, F and G at the back of this report). The following did not meet these requirements:</li> <li>Water:</li> <li>Arsenic - 67% BH8 (February 2019)</li> <li>Chromium - 86% BH8 (February 2019), 67% SW3 (June 2019)</li> <li>Cobalt - 40%</li> <li>Copper - 190% SW4 (September 2019), 156% BH6 (January 2020)</li> </ul>   |  |

| Quality assurance                 | Conformed | Comment   |
|-----------------------------------|-----------|---|
|                                   |           | <ul> <li>Lead – 67% SW4 (September 2019)</li> <li>Nickel – 156% BH7 (March 2019), 140% SW4 (September 2019), 111% SW4 (November 2019)</li> <li>Zinc – 113% BH7 (March 2019), 151% SW4 (September 2019), 172% SW4 (November 2019) &amp; 131% BH6 (January 2020)</li> <li>PFOS – 100% SW4 (September 2019)</li> <li>Sum of PFHxS and PFOS – 100% (September 2019)</li> <li>Sum of PFAS (WA DER List) – 86% (September 2019)</li> <li>Sum of PFAS – 133% (September 2019)</li> <li>A number of exceedances were calculated with one sample being below the Laboratory LOR. This leads to a potentially exaggerated RPD calculations. In order to take a conservative approach, the highest recorded concentration has been selected for results screening.</li> <li>RPD exceedances for triplicates can often be attributed to differences in methods used by each of the labs and are not considered to impair the reliability of the data in meeting the objectives of this monitoring programme.</li> </ul> |
| Internal laboratory<br>procedures | Majority. | Holding time breaches are discussed above.<br>Internal laboratory QC procedures were generally met. Some<br>exceedances of internal procedures for laboratory duplicates<br>and matrix spikes were recorded for water samples, for organic<br>analysis. However, the primary laboratory results recorded<br>these analytes to be below the LOR. Therefore, this does not<br>impair the reliability of the analytical data for decision making.<br>This is not considered to impact the outcome of the results and<br>thus unlikely to impair the outcome of decision making.  |

A summary of the water sample container types, preservation and the order of container filling is provided in **Table 6.4**.

| Analyte  | Container Type  | Preservation                 |
|--|---|------------------------------|
| PFAS incl PFOS, PFOA,<br>PFOS/PFHxS, PFDS          | 1 x 60mL Plastic Bottle - Unpreserved   | Refrigerate                  |
| TPH (C10-C36)                                      | 1 x 100mL Amber Glass Bottle - Unpreserved                                    | Refrigerate                  |
| TRH (C <sub>6</sub> -C <sub>10</sub> ), BTEXN, VOC | 2 x 40mL amber Glass Vials with Teflon lined septa                            | Sulfuric Acid                |
| Heavy metals - Dissolved                           | 1 x 60mL Clear Plastic Bottle - Filtered                                      | Nitric acid                  |

### Table 6.5 Summary of groundwater QC program

Bold: Indicates not meeting the triplicate density.

## 6.3 QUALITY STATEMENT

Field sampling procedures conformed to Kleinfelder's QA/QC protocols to prevent cross contamination, preserve sample integrity and allow for collection of a suitable data set from which to make technically sound and justifiable decisions with data of satisfactory useability.

Based on a review of the results for the Kleinfelder and laboratory QA/QC program adopted, the overall data quality is considered to be suitably reliable and representative of groundwater conditions beneath the Site. Copies of the final NATA endorsed laboratory reports, including internal QA/QC results and chain-of-custody documentation for the primary and secondary laboratories are attached as Appendix A of the monthly reports, which have been provided as **Appendix B** of this document.

## 6.4 EQUIPMENT CALIBRATION

All equipment used was supplied calibrated with appropriate calibration certificates (see **Appendix A**). Kleinfelder undertook pre-mobilisation checks of equipment (including calibration as required). Prior to commencing field operations, the following equipment and calibration checks were conducted:

- Water Quality Meter The water quality meter came calibrated from the supplier. A daily confidence check of dissolved oxygen, pH and EC was undertaken using air and standards of known concentration, and calibration performed as warranted.
- **PID** the PID came calibrated from the supplier. A daily fresh air calibration check was undertaken on site.

# 7. SUMMARY STATEMENT

A baseline water monitoring program was conducted at the Site to characterise groundwater and surface water for ongoing use of the Site as an operational sand quarry from February 2019 through to January 2020.

The analytical results indicate that metals, namely barium, chromium, copper, iron manganese, nickel and zinc, were detected regularly throughout the monitoring period, and at the majority of the sample locations, indicating likely natural background concentrations. Iron concentrations were typically higher at BH1 throughout the baseline monitoring program which are likely indicative of concentrations in this area.

BTEXN, TPH and TRH were generally not detected across the majority of the Site with the exception of BH1 and BH4. At the initiation of the baseline sampling program in February 2019 BH1 was refitted with a PVC pipe to replace a previously fire damaged one. In the process an acrylic adhesive was applied to fuse the pipes together which likely initiated increased concentrations of TPH C<sub>6</sub> - C<sub>9</sub> (1,710 $\mu$ g/L) and TRH C<sub>6</sub> - C<sub>10</sub> (1,690 $\mu$ g/L) within the well. The subsequent months following reinstallation of the well concentrations of TPH and TRH fell to below LOR. Concentration of hydrocarbons detected at BH4 are most likely influenced by the adjacent Cabbage Tree Road. Concentrations were detected following some form of rainfall in the region and ongoing detections are likely given the location of BH4 being in close proximity to a relatively busy carriageway. Ongoing monitoring of hydrocarbons is recommended, for due diligence purposes, given the potential likelihood for spills to occur from operational vehicles.

PFAS detections above LOR were recorded at locations BH4, BH6 and SW4. Concentrations of PFAS identified at BH6 and SW4 are likely sourced from an upgradient source from the Site, namely the Williamtown RAAF Base where historical use of PFAS containing materials have been used. PFAS identified at location BH4, and directly adjacent to Cabbage Tree Road, is likely to have occurred from a different historical source. Ongoing monitoring of PFAS should be undertaken directly following initial excavation works.

It should also be noted that the Site and regional area has experienced a significant drought over the past couple of years and this may have a bearing on groundwater and surface water conditions should significant rainfall reoccur in the region. Baseline data provided within this report should be reassessed following a full year of data with average to above average rainfall to identify potential outliers that may be present.

 Table 7.1 provides a summary of the proposed ongoing operational monitoring schedule for

 the Site.
 Table 7.2 provides a summary of the proposed testing schedule for the different

monitoring events and presents the adopted groundwater (GW) and surface water (SW) trigger values.

# Explanatory Notes – Soil Description

In engineering terms soil includes every type of uncemented or partially cemented inorganic material found in the ground. In practice, if the material can be remoulded by hand in its field condition or in water it is described as a soil. The dominant soil constituent is given in capital letters, with secondary textures in lower case. The dominant feature is assessed from the Unified Soil Classification system and a soil symbol is used to define a soil layer.

| METHOD     |                            |
|------------|----------------------------|

Water

Water level at date shown

# Seepage

NOT ENCOUNTERED: The borehole/test pit was dry soon after excavation. Inflow may have been observed had the borehole/test pit been left open for a longer period.

NOT OBSERVED: The observation of groundwater, whether present or not, was not possible due to drilling water, surface seepage or cave in of the borehole/test pit.

#### UNIFIED SOIL CLASSIFICATION

The appropriate symbols are selected on the result of visual examination, field tests and available laboratory tests, such as sieve analysis, liquid limit and plasticity index.

| USC Symbol | Description                     |
|------------|---------------------------------|
| GW         | Well graded gravel              |
| GP         | Poorly graded gravel            |
| GM         | Silty gravel                    |
| GC         | Clayey gravel                   |
| SW         | Well graded sand                |
| SP         | Poorly graded sand              |
| SM         | Silty sand                      |
| SC         | Clayey sand                     |
| ML         | Silt of low plasticity          |
| CL         | Clay of low plasticity          |
| OL         | Organic soil of low plasticity  |
| CI         | Clay of medium plasticity       |
| MH         | Silt of high plasticity         |
| СН         | Clay of high plasticity         |
| ОН         | Organic soil of high plasticity |
| Pt         | Peaty soil                      |
|            |                                 |

# MOISTURE CONDITION

| Dry      | Cohesive soils are friable or powdery      |
|----------|--|
|          | Cohesionless soil grains are free-running. |
| Moist    | Soil feels cool, darkened in colour        |
|          | Cohesive soils can be moulded              |
|          | Cohesionless soil grains tend to adhere.   |
| Wet      | Cohesive soils usually weakened            |
|          | Free water forms on hands when handling.   |
| <b>F</b> |  |

For cohesive soils the following codes may also be used:

MC>PL Moisture Content greater than the Plastic Limit.

MC-PL Moisture Content near the Plastic Limit.

MC<PL Moisture Content less than the Plastic Limit.

### PLASTICITY

The potential for soil to undergo change in volume with moisture change is assessed from its degree of plasticity. The classification of the degree of plasticity in terms of the Liquid Limit (LL) is as follows.

| Description of Plasticity | LL(%)    |  |  |
|---------------------------|----------|--|--|
| Low                       | <35      |  |  |
| Medium                    | 35 to 50 |  |  |
| High                      | >50      |  |  |

#### **COHESIVE SOILS – CONSISTENCY**

The consistency of a cohesive soil is defined by descriptive terminology such as very soft, soft, firm, stiff, very stiff and hard. These terms are assessed by the shear strength of the soil as observed visually, by hand penetrometer values and by resistance to deformation to hand moulding. A Hand Penetrometer may be used in the field or the laboratory to provide an approximate assessment of the unconfined compressive strength (UCS) of cohesive soils. Undrained shear strength Cu =  $0.5 \times UCS$ . The UCS values are recorded in kPa as follows:

| Strength   | Symbol | Unconfined Compressive Strength,<br>q <sub>u</sub> (kPa) |
|------------|--------|--|
| Very Soft  | VS     | < 25   |
| Soft       | S      | 25 to 50   |
| Firm       | F      | 50 to 100  |
| Stiff      | St     | 100 to 200   |
| Very Stiff | VSt    | 200 to 400   |
| Hard       | Н      | > 400  |

# **COHESIONLESS SOILS – RELATIVE DENSITY**

Relative density terms such as very loose, loose, medium, dense and very dense are used to describe silty and sandy material, and these are usually assessed based on penetration test results (eg Standard Penetration Test (SPT) N values) in conjunction with published correlations. Other condition terms, such as friable, powdery or crumbly may also be used.

| Term         | Symbol | Density<br>Index |  |
|--------------|--------|------------------|--|
| Very Loose   | VL     | 0 to 15          |  |
| Loose        | L      | 15 to 35         |  |
| Medium Dense | MD     | 35 to 65         |  |
| Dense        | D      | 65 to 85         |  |
| Very Dense   | VD     | >85              |  |

# COHESIONLESS SOILS PARTICLE SIZE DESCRIPTIVE TERMS

| Subdivision | Size   |
|-------------|--|
|             | >200 mm                                      |
|             | 63 mm to 200 mm                              |
| Coarse      | 20 mm to 63 mm                               |

# **Explanatory Notes - Rock Description**

# METHOD

Refer soil description sheet.

# WATER

Refer soil description sheet.

# **ROCK QUALITY**

The fracture spacing is shown where applicable and the Rock Quality Designation (RQD) or Total Core Recovery (TCR) is given where:

TCR (%) = <u>length of core recovered</u> length of core run

RQD (%) = sum of axial lengths of core > 100mm long length of core run.

## **ROCK MATERIAL WEATHERING**

Rock weathering is described using the abbreviations and definitions used in AS1726.

| Term                            | Symbol | Definition   |
|---------------------------------|--------|--|
| Residual soil                   | RS     | Soil developed on extremely<br>weathered rock; the mass structure<br>and substance fabric are no longer<br>evident; there is a large change in<br>volume but the soil has not been<br>significantly transported.                           |
| Extremely<br>weathered<br>rock  | XW     | Rock is weathered to such an extent<br>that it has 'soil' properties, ie, it<br>either disintegrates or can be<br>remoulded in water.  |
| Distinctly<br>weathered<br>rock | DW     | Rock strength usually changed by<br>weathering. The rock may be highly<br>discoloured, usually by iron staining.<br>Porosity may be increased by<br>leaching, or may be decreased due<br>to deposition of weathering products<br>in pores. |
| Slightly<br>weathered<br>rock   | SW     | Rock is slightly discoloured but<br>shows little or no change of strength<br>from fresh rock.  |
| Fresh rock                      | FR     | Rock shows no sign of decomposition or staining.   |

# ROCK STRENGTH

Rock strength is described using AS1726 and ISRM – Commission on Standardisation of Laboratory and Field Tests, 'Suggested method of determining the Uniaxial Compressive Strength of Rock materials and the Point Load Index' as follows:

| <b>S</b> 50 |
|-------------|
|             |
|             |
|             |
|             |
|             |
|             |
|             |
| _           |

Diametral Point Load Index test.

, Axial Point Load Index test.

# DEFECT SPACING/BEDDING THICKNESS

Measured at right angles to defects of same set or bedding.

| Term                     | Defect Spacing | Bedding          |
|--------------------------|----------------|------------------|
| Extremely closely spaced | <6 mm          | Thinly laminated |
|                          | 6 to 20 mm     | Laminated        |
| Very closely spaced      | 20 to 60 mm    | Very thin        |
| Closely spaced           | 0.06 to 0.2 m  | Thin             |
| Moderately widely spaced | 0.2 to 0.6 m   | Medium           |
| Widely spaced            | 0.6 to 0.2 m   | Thick            |
| Very widely spaced       | >2 m           | Very thick       |

Robert Carr & Associates Pty Ltd Trading as RCA Laboratories – Environmental 92 Hill Street PO Box 175, Carrington NSW 2294 ABN 53 063 515 711 Ph 02 4902 9200 – Fax 02 4902 9299 Email: administrator@rca.com.au Web www.rca.com.au

# Acid Sulfate Soil Screening

Note: This screening test only provides an indication of the likely presence and severity of Acid Sulfate Soils. This test should not be used as a substitute for laboratory analysis which would positively identify the presence of Acid Sulfate Soils (ASS) for assessment purposes.

NATA Scope of Accreditation does not cover the sampling of soils by the client or by RCA Employees.

Analysis for pH and Acid Sulphate Screen Testing is covered by RCA Laboratories - Environmental NATA Scope of Accreditation.

Analysis on samples is on an as received basis.

# Acid Sulfate Soil Screening Test Reaction Rate

^Reaction Rate: 0 = No Reaction, 1 = Slight, 2 = Moderate, 3 = High, 4 = Very Vigorous

Note: Due to the subjectivity the assessment of the Reaction Rate is not covered by our NATA Scope of Accreditation.

Robert Carr and Associates Pty Ltd shall not be liable for loss, cost, damages or expenses incurred by the client, or any other person or company resulting from the use of any information or interpretation given in this report. In no case shall RCA limited be liable for consequential damages including, but not limited to loss profits damages for failure to meet deadlines and lost production arising from this report. This document shall not be reproduced except in full and relates only to the liems tested. Unless indicated otherwise, the tests were performed on the samples as received. Sampled dates quoted in this report are those listed on the COC or sample jars; if no sample dates are noted, the date the samples are received at the laboratory have been used. The Laboratory is accredited for compliance with ISO/IEC 17025.The results of the tests, calibrations &/or measurements included in this document are traceable to Australian / National Standards.

# **RCA Internal Quality Review**

# General

- Laboratory QC results for Method Blanks, Duplicates and Laboratory Control Samples are included in this QC report where applicable. Additional QC data maybe 1. available on request.
- 2. RCA QC Acceptance / Rejection Criteria are available on request. Proficiency Trial results are available on request. 3
- Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences. 4.
- 5. When individual results are qualified in the body of a report, refer to the qualifier descriptions that follow.
- Samples were analysed on an 'as received' basis. 6.
- 7. Sampled dates in this report are those listed on the COC or sample jars; if no sample dates are noted, the date the samples are received at the laboratory have been used.
- All soil results are reported on a dry basis, unless otherwise stated. (ACID SULFATE SOILS) 8.
- 9. This report replaces any interim results previously issued.

# Holding Times.

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample

Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported. Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control. ##NOTE: pH duplicates are reported as a range NOT as RPD

#### **QC - ACCEPTANCE CRITERIA**

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50% Results >20 times the LOR: RPD must lie between 0-30%

# QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.

2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.

3. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

### Glossary

#### UNITS

mg/kg: milligrams per Kilogram ug/L: micrograms per litre ppm: Parts per million ppb: Parts per billion %: Percentage org/100ml: Organisms per 100 millilitres NTU: Units MPN/100mL: Most Probable Number of organisms per 100 millilitres mg/L: milligrams per Litre

# TERMS

Dry Where moisture has been determined on a solid sample the result is expressed on a dry basis.

LOR Limit of Reporting. RPD Relative Percent Difference between two Duplicate pieces of analysis can be obtained upon request. QCS Quality Control Sample - reported as value recovery Method Blank In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water. Duplicate A second piece of analysis from the same sample and reported in the same units as the result to show comparison. Batch Duplicate A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis. USEPA United States Environment Protection Authority APHA American Public Health Association COC Chain of Custody CP Client Parent - QC was performed on samples pertaining to this report NCP Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within < indicates less than

# General Comments

developed procedures are employed in the absence of documented standards or by client request. The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

- Key : LOR = Limit of reporting CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
- ^ = This result is computed from individual analyte detections at or above the level of reporting
- $\emptyset$  = ALS is not NATA accredited for these tests.
- ASS: EA029 (SPOCAS): Excess ANC not required because pH OX less than 6.5.
- ٠ ASS: EA029 (SPOCAS): Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime (CaCO3) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from kg/t dry weight to kg/m3 in-situ soil, multiply reported results x wet bulk density of soil in t/m3.

## General Comments

developed procedures are employed in the absence of documented standards or by client request. The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

- Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
- LOR = Limit of reporting **^** = This result is computed from individual analyte detections at or above the level of reporting
- ø = ALS is not NATA accredited for these tests.

Robert Carr and Associates Pty Ltd shall not be liable for bss, cost, damages or expenses incurred by the client, or any other person or company resulting from the use of any information or interpretation given in this report. In no case shall RCA limited be liable for consequential damages including, but not limited to, bos profits damages for failure to meet deadlines and bost production arising from this report. This document shall not be reproduced except in full and relates only to the terms tested. Unless indicated otherwise, the tests were performed on the samples as received. Sampled dates quoted in this report are those listed on the CCC or sample fast, in on sample dates are noted, the date the samples are received at the belonatory have been used. The Laboratory is accredited for compliance with ISO/IEC 17025.The results of the tests, calibrations &/or measurements included in this document are traceable to Australian / National Standards.

### **RCA Internal Quality Review**

### General

- 1. Laboratory QC results for Method Blanks, Duplicates and Laboratory Control Samples are included in this QC report where applicable. Additional QC data maybe available on request.
- RCA QC Acceptance / Rejection Criteria are available on request.
   Proficiency Trial results are available on request.
- Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
- When individual results are qualified in the body of a report, refer to the qualifier descriptions that follow.
- Samples were analysed on an 'as received' basis.
- Sampled dates in this report are those listed on the COC or sample jars; if no sample dates are noted, the date the samples are received at the laboratory have been used.
- 8. All soil results are reported on a dry basis, unless otherwise stated. (ACID SULPHATE SOILS)
- 9. This report replaces any interim results previously issued.

### Holding Times.

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample

Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported. Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control. ##NOTE: pH duplicates are reported as a range NOT as RPD

**QC - ACCEPTANCE CRITERIA** 

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50% Results >20 times the LOR: RPD must lie between 0-30%

Results >20 times the LOR. RFD must be between 0-30

### QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.

2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.

3. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

### Glossary

### UNITS

mg/kg: milligrams per Kilogram ug/L: micrograms per litre ppm: Parts per million ppb: Parts per billion %: Percentage org/100ml: Organisms per 100 millilitres NTU: Units MPN/100mL: Most Probable Number of organisms per 100 millilitres mg/L: milligrams per Litre

### TERMS

Dry Where moisture has been determined on a solid sample the result is expressed on a dry basis. LOR Limit of Reporting. RPD Relative Percent Difference between two Duplicate pieces of analysis can be obtained upon request. QCS Quality Control Sample - reported as value recovery Method Blank In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water. Duplicate A second piece of analysis from the same sample and reported in the same units as the result to show comparison. Batch Duplicate A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis. USEPA United States Environment Protection Authority APHA American Public Health Association COC Chain of Custody CP Client Parent - QC was performed on samples pertaining to this report NCP Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within < indicates less than > Indicates greater than IS Insufficient sample for analysis

### Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation). If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

| Description   | Testing Site | Extracted    | Holding Time |
|---|--------------|--------------|--------------|
| Major Cations   |              |              |              |
| Ammonia (as N)  | Sydney       | Feb 19, 2015 | 28 Day       |
| - Method: E036/E050 Ammonia as N                            |              |              |              |
| Alkali Metals   | Sydney       | Feb 19, 2015 | 180 Day      |
| - Method: E022/E030 Unfiltered Cations in Water             |              |              |              |
| Major Anions  |              |              |              |
| Bicarbonate Alkalinity (as CaCO3)                           | Sydney       | Feb 20, 2015 | 14 Day       |
| - Method: E035 Alkalinity (CO3, HCO3, OH)                   |              |              |              |
| Carbonate Alkalinity (as CaCO3)                             | Sydney       | Feb 20, 2015 | 14 Day       |
| - Method: E035 Alkalinity (CO3, HCO3, OH)                   |              |              |              |
| Chloride  | Sydney       | Feb 20, 2015 | 28 Day       |
| - Method: E033 /E045 /E047 Chloride                         |              |              |              |
| Nitrate (as N)  | Sydney       | Feb 20, 2015 | 28 Day       |
| - Method: E037 /E051 Nitrate as N                           |              |              |              |
| Sulphate (as S)   | Sydney       | Feb 20, 2015 | 28 Day       |
| - Method: E045 Sulphate                                     |              |              |              |

### Eurofins | mgt Internal Quality Control Review and Glossary

### General

- 1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
- 2. All soil results are reported on a dry basis, unless otherwise stated.
- 3. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
- 4. Results are uncorrected for matrix spikes or surrogate recoveries.
- 5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
- 6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

### **Holding Times**

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

\*\*NOTE: pH duplicates are reported as a range NOT as RPD

### UNITS

| mg/kg: milligrams per Kilogram                                   | mg/l: milligrams per litre         |
|--|------------------------------------|
| ug/l: micrograms per litre                                       | ppm: Parts per million             |
| ppb: Parts per billion   | %: Percentage                      |
| org/100ml: Organisms per 100 millilitres                         | NTU: Nephelometric Turbidity Units |
| MPN/100mL: Most Probable Number of organisms per 100 millilitres |                                    |

### TERMS

| Dry              | Where a moisture has been determined on a solid sample the result is expressed on a dry basis.  |
|------------------|---|
| LOR              | Limit of Reporting.   |
| SPIKE            | Addition of the analyte to the sample and reported as percentage recovery.  |
| RPD              | Relative Percent Difference between two Duplicate pieces of analysis.   |
| LCS              | Laboratory Control Sample - reported as percent recovery  |
| CRM              | Certified Reference Material - reported as percent recovery   |
| Method Blank     | In the case of solid samples these are performed on laboratory certified clean sands.   |
|                  | In the case of water samples these are performed on de-ionised water.   |
| Surr - Surrogate | The addition of a like compound to the analyte target and reported as percentage recovery.  |
| Duplicate        | A second piece of analysis from the same sample and reported in the same units as the result to show comparison.  |
| Batch Duplicate  | A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.                                 |
| Batch SPIKE      | Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.                                 |
| USEPA            | United States Environmental Protection Agency   |
| APHA             | American Public Health Association  |
| ASLP             | Australian Standard Leaching Procedure (AS4439.3)   |
| TCLP             | Toxicity Characteristic Leaching Procedure  |
| COC              | Chain of Custody  |
| SRA              | Sample Receipt Advice   |
| CP               | Client Parent - QC was performed on samples pertaining to this report   |
| NCP              | Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within |
| TEQ              | Toxic Equivalency Quotient  |
|                  |   |

### **QC - ACCEPTANCE CRITERIA**

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

### QC DATA GENERAL COMMENTS

- 1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
- 2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
- 3. Organochlorine Pesticide analysis where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
- 4. Organochlorine Pesticide analysis where reporting Spike data, Toxophene is not added to the Spike.
- 5. Total Recoverable Hydrocarbons where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
- pH and Free Chlorine analysed in the laboratory Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
- 7. Recovery Data (Spikes & Surrogates) where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
- 8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
- 9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
- 10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

### Comments

| Sample Integrity  |     |
|---|-----|
| Custody Seals Intact (if used)  | N/A |
| Attempt to Chill was evident  | Yes |
| Sample correctly preserved  | Yes |
| Appropriate sample containers have been used                            | Yes |
| Sample containers for volatile analysis received with minimal headspace | Yes |
| Samples received within HoldingTime                                     | Yes |
| Some samples have been subcontracted                                    | No  |

Blank Cell indicates no criterion available

PQL = Practical Quantitation Limit. Where PQL is for a summation, PQL of all

components is summed and may be different from that presented by laboratory

<sup>A</sup> ANZECC 2000 95% Protection Level for marine water

<sup>B</sup> NHMRC Australian Drinking Water Guidelines, 2011

<sup>C</sup>Sample depths presented are as encountered during sampling

 $^{\scriptscriptstyle \mathsf{D}}$  Bioaccummulative Compounds

<sup>E</sup> TDS calculated using laboratory reported electrical conductivity values

ANZECC guidelines in *italics* are low level reliability guidelines

ANZECC arsenic guideline based on As (III) for marine water, the lowest of presented guidelines.

NHMRC arsenic guidelines are based on total arsenic

ANZECC and NHMRC guidelines for chromium are based on Cr (VI)

ANZECC guidelines for mercury are based on inorganic mercury.

NHMRC guidelines for mercury are based on total mercury.

Results shown in BOLD are in excess of the aquatic ecosystems guidelines

Results shown in <u>underline</u> are in excess of the human health (ingestion) guideline

Blank Cell indicates no criterion available

PQL = Practical Quantitation Limit. Where PQL is for a summation, PQL of all

components is summed and may be different from that presented by laboratory

<sup>A</sup> ANZECC 2000 95% Protection Level for marine water

<sup>B</sup> NHMRC Australian Drinking Water Guidelines, 2011

<sup>C</sup>Sample depths presented are as encountered during sampling

 $^{\scriptscriptstyle \mathsf{D}}$  Bioaccummulative Compounds

<sup>E</sup> TDS calculated using laboratory reported electrical conductivity values

ANZECC guidelines in *italics* are low level reliability guidelines

ANZECC arsenic guideline based on As (III) for marine water, the lowest of presented guidelines.

NHMRC arsenic guidelines are based on total arsenic

ANZECC and NHMRC guidelines for chromium are based on Cr  $\left( \text{VI} \right)$ 

ANZECC guidelines for mercury are based on inorganic mercury.

NHMRC guidelines for mercury are based on total mercury.

Results shown in BOLD are in excess of the aquatic ecosystems guidelines

Results shown in <u>underline</u> are in excess of the human health (ingestion) guideline

# Subject: Water quality monitoring results at Cabbage Tree Road Sand Quarry – February 2019 monitoring

Please find enclosed the Water quality monitoring results at Cabbage Tree Road Sand Quarry for the February 2019 monitoring.

# 1. SCOPE OF SERVICE

The scope of work includes monthly surface and groundwater monitoring for a combined period of 12 months. **Figure 1** (attached) presents the surface water and groundwater sampling locations.

The February monitoring round was to include gauging and sampling from 13 monitoring wells (Noting that MW239D was also gauged but not was not proposed to be sampled) and sampling at four surface water locations.

# 2. SITE WORK

The monitoring round was conducted on 21 and 22 February 2019.

Each well location was gauged using a water level meter to determine groundwater depth (relative to the top of the well casing) and the total depth of the well, in order to calculate the volume of water in the well. Following the gauging a HydraSleeve was then placed into the well ensuring the top of the sleeve was located under the water and left in place while all remaining wells were gauged. Following the gauging each of the HydraSleeves were removed and samples taken.

The February 2019 monitoring round included:

• Gauging of all available monitoring wells (a total of 14 wells);

- Groundwater sampling from a total of 9 monitoring wells (note MW239D does not require sampling, BH1, BH09, BH10 and BH12 were dry); and
- Surface water sampling from 1 location (all remaining locations were dry on the day of sampling).

Water samples were collected in laboratory supplied containers and place in an ice chilled esky. The samples were then submitted to a NATA accredited laboratory under a chain of custody (COC) for the analytical schedule as per **Table 2-1**.

# 4. RAINWATER DATA

**Table 4.5** presents the rainfall data from Williamtown RAAF base. The mean monthly rainfall indicates that there has been significantly less rainfall in January and February than the mean.

Table 4.52019 Rainfall data

Based on the rainfall data, it is expected that the current groundwater and surface water levels would be low.
